About This Manual

This book describes the motion library TML_LIB v2.0. The book is common for Microsoft Windows and Linux x86 versions of the library. The TML_LIB is a collection of functions, which can be integrated in a PC application. For Microsoft Windows version of the TML_LIB you can write the application in C#, C/C++, Delphi Pascal or Visual Basic. For Linux platforms the application for TML_LIB must be written in C/C++. With TML_LIB motion library, you can quickly program the desired motion and control the Technosoft intelligent drives and motors (with the drive integrated in the motor case) from a PC. The TML_LIB allows you to communicate with Technosoft drive/motors via serial RS-232, RS-485, CAN-bus or Ethernet protocols.

Scope of This Manual

This manual applies to the following Technosoft intelligent drives and motors:

- **iPOS** family of drives (all firmware revisions)
- **iMOT** family of intelligent motors (all firmware revisions)
- **IDM240 / IDM640** (all models), with firmware F000H/F250A/F251A or later (revision letter must be equal or after H i.e. I, J, etc.)
- **IDM680** (all models), with firmware F500A/F501A or later
- **IDM3000** (all models), with firmware F037K/F256A or later
- **ISD720 / ISD860** (all models) with firmware F0001/F250A or later
- **ISCM4805 / ISCM8005** (all models), with firmware F000H/F250A/F251A or later
- **ISM4803** (all models), with firmware F024I or later
- **IBL3605 / PIM3605** (all models), with firmware F020K/F253A/F254A or later
- **IBL2403 / PIM2403** (all models), with firmware F020H/F253A/F254A or later
- **IBL2401 / PIM2401** (all models), with firmware F020H/F253A/F254A or later
- **IPS110** (all models), with firmware F005H/F255A or later
- **IPS210** (all models), with firmware F005H/F255A or later
• IM23x (models IS and MA), with firmware F900H/F252A or later
• IS23x (models MA), with firmware F903H/F261A or later

**IMPORTANT!** For correct operation, the drives/motors must be programmed with one of the firmware revision listed above. *EasySetUp*¹ - Technosoft IDE for drives/motors setup, includes a firmware programmer with which you can check your drive/motor firmware version and revision and if needed, update your drive/motor firmware to revision H.

**Notational Conventions**

This document uses the following conventions:

- Drive/motor - an *intelligent drive* or an *intelligent motor* having the drive part integrated in the motor case
- TML – Technosoft Motion Language
- IU – drive/motor internal units
- ACR.5 – bit 5 of ACR data
- FAxx – firmware versions F000H, F020H, F024I, F005H, F900H, F250A, F251A or later
- FBxx – firmware versions F5xxA or later

**Related Documentation**

*Help of the EasyMotion Studio software platform* – describes how to use the EasyMotion Studio, which support all new features added to revision H of firmware. It includes: motion system setup & tuning wizard, motion sequence programming wizard, testing and debugging tools like: data logging, watch, control panels, on-line viewers of TML registers, parameters and variables, etc.

*MotionChip™ II TML Programming* (part no. P091.055.MCII.TML.UM.xxxx) describes in detail TML basic concepts, motion programming, functional description of TML instructions for high level or low level motion programming, communication channels and protocols. Also give a detailed description of each TML instruction including syntax, binary code and examples.

*MotionChip II Configuration Setup* (part no. P091.055.MCII.STP.UM.xxxx) describes the MotionChip II operation and how to setup its registers and parameters starting from the user application data. This is a technical reference manual for all the MotionChip II registers, parameters and variables.

¹ *EasySetUp* is included in TML_LIB installation media as a component of *EasyMotion Studio Demo version*. It can also be downloaded free of charge from Technosoft web page.

1 Introduction

The programming of Technosoft intelligent drives/motors involves 2 steps:

1) Drive/motor setup
2) Motion programming

For Step 1 – drive/motor setup, Technosoft provides EasySetUp. EasySetUp is an integrated development environment for the setup of Technosoft drives/motors. The output of EasySetUp is a collection of setup data, which can be downloaded to the drive/motor non-volatile memory (EEPROM) or saved on the PC for later use. The drive/motor copies the setup data from the EEPROM into the RAM memory at power-on and use it during runtime. The reciprocal is also possible i.e. to retrieve the complete setup data from a drive/motor non-volatile memory previously programmed. EasySetUp can be downloaded free of charge from Technosoft web page. It is also provided on the TML_LIB installation media.

For Step 2 – motion programming, Technosoft offers multiple options, like:

1) Use the drives/motors embedded motion controller and do the motion programming in Technosoft Motion Language (TML). For this operation Technosoft provides EasyMotion Studio, an IDE for both drives setup and motion programming. The output of EasyMotion Studio is a collection of setup data and a TML program to download and execute on the drive/motor.
2) Use a .DLL with high-level motion functions which can be integrated in a host application written in C#, C/C++, Delphi Pascal, Visual Basic or LabVIEW
3) Use a PLCopen compatible library with motion function blocks which can be integrated in a PLC application based on one of the IEC 61136 standard languages
4) Combine option 1) with options 2) or 3) to really distribute the intelligence between the master/host and the drives/motors in complex multi-axis applications. Thus, instead of trying to command each step of an axis movement, you can program the drives/motors using TML to execute complex tasks and inform the master when these are done.

The TML_LIB library is part of option 2) – a collection of functions allowing you to implement motion control applications on a PC computer. The link between the Technosoft drives/motors and the PC can be done via serial link, via CAN-bus using a PC to CAN interface or via Ethernet using an adapter/bridge between Ethernet and RS-232/CAN. Realized as a collection of high-level functions, the library allows you to focus on the main aspects related to your application specific implementation, and to simply use the drive and execute motion commands by calling appropriate functions from the library.

This manual presents how to install and use the components of the TML_LIB library.

Remarks:

- Option 4) requires using EasyMotion Studio instead of EasySetUp. With EasyMotion Studio you can create high-level motion functions in TML, to be called from master/host.
- EasyMotion Studio is also recommended if your application includes a homing as it comes with 32 predefined homing procedures to select from, with the possibility to adapt them.
**Figure 1.1. Using TML_LIB to control a Technosoft intelligent drive from the PC computer**

```c
int InValue = 0;
while (InValue == 0) {
    TS_GetInput(INPUT5, &InValue);
}
```

MyCode.C
...
TS_SelectAxis(5);
TS_MoveVelocity(12.5, MOVE_IMMEDIATE, FROM_REFERENCE);
TS_SetEventOnTime(200, WAIT_EVENT, NO_STOP);
Int InValue = 0;
While(InValue == 0) TS_GetInput(INPUT5, &InValue);
TS_Stop();
2 Getting started

2.1 Hardware installation
For the hardware installation of the Technosoft drives/motors see their user manual.

For drives/motors setup, you can connect your PC to any drive/motor using an RS232 serial link.
Through this serial link you can access all the drives/motors from the network. Alternately, you
can connect your PC directly on the CAN bus network if it is equipped with one of the CAN
interfaces supported by EasySetUp.

2.2 Software installation on Microsoft Windows platforms
In order to perform successfully the following software installations, make sure that you have the
“Administrator” rights.

2.2.1 Installing EasySetUp
On the TML_LIB installation CD you’ll find the setup for EasyMotion Studio Demo version. This
application includes a fully functional version of EasySetUp and a demo version of EasyMotion
Studio. Start the setup and follow the installation instructions.

2.2.2 Installing TML_LIB library
Start the TML_LIB setup and follow the installation instructions. The package contents of the
TML_LIB for Microsoft Windows is described in Appendix A.

Remark: The Delphi application and the TML_lib.dll file must be in the same directory at run time.
Hence, you have to copy the TML_lib.dll file in the Delphi project’s folder (by default
examples/DELPHIDemo) before running the application.

2.3 Software installation on Linux x86 architectures
In order to perform successfully the following software installations, make sure that you have the
“Root” rights and the following programs installed: tar, gzip and sed. Also, the TML_LIB library
requires the GNU C library version 2 (gcc-lib-2.*) and GNU Compiler Collection release 3 (gcc-
3.*).

2.3.1 Installing Microsoft Windows emulator
EasyMotion Studio and EasySetUp are applications build for Microsoft Windows operating
systems. Hence to use the applications you must install an emulator for Microsoft Windows, for
example Wine.

2.3.2 Installing EasySetUp
On the TML_LIB installation CD you’ll find the setup for EasyMotion Studio Demo version. This
application includes a fully functional version of EasySetUp and a demo version of EasyMotion
Studio. Start the setup using the Microsoft Windows emulator and follow the installation
instructions.
2.3.3 Installing TML_LIB library

From the TML_LIB installation CD copy the file TML_lib_linux_x86.run. Change the file’s access permissions with the command `chmod ugo +x TML_lib_linux_x86.run` and launch it. After you fill the registration information the library files will be automatically saved in the appropriate directories.

2.4 Build the host application with TML_lib

2.4.1 Drive/motor setup

Before starting to send motion commands from the PC, you need to do the drive/motor setup according with your application needs. For this operation you have to use EasySetUp, the integrated development environment for the configuration of the Technosoft drives and motors.

The output of EasySetUp is the setup table with all the information needed to configure and parameterize a Technosoft drive/motor. It must be downloaded to the drive/motor non-volatile memory. The setup table is copied at power-on into the RAM memory of the drive/motor and is used during runtime.

Steps for commissioning a Technosoft drive/motor

Step 1. Start EasySetUp

For Microsoft Windows platforms execute: “Start | Programs | EasySetUp | EasySetUp” or “Start | Programs | EasyMotion Studio | EasySetUp” depending on which installation package you have used. On Linux platforms use the Microsoft Windows emulator to start EasySetUp.

Step 2. Establish communication

Use the Communication | Setup command to check/change your PC communication settings. In the Communication Setup dialog select and configure the communication channel between the PC and the drive/motor. Press the Help button to find detailed information on how to setup the communication channels supported. Power on the drive/motor and then press the OK button to close the Communication | Setup dialog.

If the communication is established, then EasySetUp will display in the status bar (the bottom line) the text “Online” plus the axis ID of your drive/motor and its firmware version. Otherwise the text displayed is “Offline” and a communication error message informs you the error type. In this case, return to the Communication | Setup dialog, press the Help button and check troubleshoots.

Remark: When first started, EasySetUp tries to communicate with your drive/motor via RS-232 and COM1 (default communication settings). If your drive/motor is powered and connected to your PC port COM1 via an RS-232 cable, the communication can be automatically established.

Step 3. Setup drive/motor

Press New button and select your drive/motor type. Depending on the product chosen, the selection may continue with the motor technology (for example: brushless motor, brushed motor) or the control mode (for example stepper – open-loop or stepper – closed-loop) and type of feedback device (for example: incremental encoder, SSI encoder)
This opens 2 setup dialogues: for **Motor Setup** and for **Drive setup** through which you can configure and parameterize a Technosoft drive/motor, plus several predefined control panels customized for the product selected.

In the **Motor setup** dialogue you can introduce the data of your motor and the associated sensors. Data introduction is accompanied by a series of tests having as goal to check the connections to the drive and/or to determine or validate a part of the motor and sensors parameters. In the **Drive setup** dialogue you can configure and parameterize the drive for your application. In each dialogue you will find a **Guideline Assistant**, which will guide you through the whole process of introducing and/or checking your data. Close the Drive setup dialogue with **OK** to keep all the changes regarding the motor and the drive setup.

**Step 4. Download setup table to drive/motor**

Press the **Download to Drive/Motor** button to download your setup data in the drive/motor non-volatile memory in the **setup table**. From now on, at each power-on, the setup data is copied into the drive/motor RAM memory that is used during runtime.

**Step 5. Reset the drive/motor to activate the drive setup data**

**Step 6. Create the setup data for TML_LIB**. The TML_LIB requires drive/motor setup information for the proper execution of the application. The setup data is generated with the **Setup | Export to TML_LIB...** command if you are in EasySetUp, or the **Application | Export to TML_LIB...** command if you are using EasyMotion Studio. The information is generated in the form of an archive file with the `.t.zip` extension and is saved in the **Archives** folder from EasySetUp/EasyMotion Studio installation folder (by default C:\Program Files\Technosoft\ESM\).

**2.4.2 Build your application with TML_LIB**

TML_LIB is a collection of high level functions, grouped in several categories and provided as the **TML_LIB.dll** file.

Most of these functions are of Boolean type, and return a `True` value if the execution of the function performed without any error (at PC level). If the function returns a `False` value, you can retrieve the error description by calling the function **TS_GetLastErrorText**.

**Steps to build the host application with TML_LIB:**

1. **Create the PC application’s project.** Launch your development environment and create a new project. For details read the development environment online help.

   **Remark:** For Borland C++ projects the user must define a WINDOWS or WIN32 symbol in order to compile the C/C++ application.

2. **Setup the communication.** The host application is based on the communication between PC and Technosoft drives/motors thus it should begin with the communication channel setup. The communication channel is opened with the **TS_OpenChannel** function. At the end of the application you must close the communication channel with function **TS_CloseChannel**.

3. **Load setup configurations.** The setup information is required by the library functions in order to check if there are incompatibilities between the drive and the operation to be executed (as an example, avoiding issuing an “Output port” command to a port which is an input port on that drive). The setup data is generated by EasySetUp/EasyMotion Studio
based on your actual configuration. The setup information is in the form of archive files with the .t.zip extension. The .t.zip files are saved by default in the Archives folder from EasyMotion Studio/EasySetUp installation folder. The setup data of the drive/motor are declared using the TS_LoadSetup function in the PC application. The TS_LoadSetup has as argument the *.t.zip file. The function must be called for each axis controlled through TML_lib library.

4. **Setup axis.** Each axis defined at PC level requires the setup information. The configuration setup is associated to an axis with function **TS_SetupAxis**.

5. **Select the active axis/group.** The messages sent from the PC address to one axis. Use function **TS_SelectAxis** to choose the messages destination. All further function calls, which send TML messages on the communication channel, will address the messages to this active axis.

6. **Program the motion for current axis.** Use the TML_LIB functions to program the motion sequences required.
3 TML_LIB description

3.1 Basic concept
The Technosoft intelligent drives are programmable using the Technosoft Motion Language (TML). TML consists of a high-level set of codes allowing the user to parameterize and execute specific motion operations.

TML allows to:
- Configure the motion mode (profiles, contouring, gearing in multiple axes structures, etc.)
- Detect / specifically treat external signals as limit switches, captures
- Execute homing sequences
- Setup / start specific action on pre-defined motion events
- Synchronize multiple axes structures, by sending group commands
- etc.

The TML_LIB library is the tool that helps you to handle the process of motion control application implementation on a PC computer, at a high level, without the need to write / compile TML code.

A central element of the library is the communication kernel, which is responsible of correct opening of the communication channel (serial RS-232 or RS-485, CAN-bus or Ethernet), as well as of TML messages handling. This includes handling of the specific communication protocol, for each of these channels.

Consequently, each application you’ll develop starts with the opening of the communication channel, i.e. calling the TS_OpenChannel function. The application must end with the TS_CloseChannel function call.

You’ll be able to handle multiple-axis applications from the PC. Besides the drive/motor setup with EasySetUp or EasyMotion Studio, you’ll also need to indicate some basic drive information for correct usage of the library functions. Thus, for each drive that is installed in the system, you’ll need to execute the TS_SetupAxis function, indicating the axis ID and configuration setup. Such information will be used for some functions of the library, in order to check if there are incompatibilities between the drive and the operation to be executed (as an example, avoiding issuing an “Output port” command to a port which is an input port on that drive).

Note that besides setting-up individual axes, it is also possible to setup groups of axes (with the TS_SetupGroup function). This allows you to issue commands which will be received and executed simultaneously on all the axes initialized as belonging to that group.

Once all the axes are defined, the library allows you to select the active axis or group, using the TS_SelectAxis, or TS_SelectGroup function respectively. Consequently, all future commands that you’ll execute after the selection of one axis or group will be addressed to that axis or group. You can change at any time in your program the active axis/group. Also, a command can be sent to all the axes form the newtwork, by selecting the destination with the TS_SelectBroadcast function.
3.2 Multithread and multiprocess applications with TML_LIB

The TML_LIB library supports multithread applications developed under C/C++ and Delphi. Each thread created in your application has to setup the communication, the axes and program the motion commands. For details about threads see the documentation of your development environment.

Remarks:

1. For multithread applications created for Microsoft Windows, under Visual C++, the communication module of TML_LIB library, the tmlcomm.dll, must be dynamically linked at load-time.
2. The examples included in the package use the single thread variant of the library with the exception of Ex08_PVT. The example Ex08_PVT is available only for C/C++ and Delphi.
3. Applications developed under Visual Basic must use the single thread variant of the TML_lib.

The following example presents the basic steps for creating a multithread application using C runtime library and the Win32 API:

1. Include the header <windows.h> for all the Win32 specific thread information
2. Define an array of handles and an array of thread id’s.
3. Declare structures for passing to the controlling functions of each thread (define here the parameters you might be interested on).
4. Define global pointers to the structures required.
5. Declare the control functions for each thread. In Win32, thread functions MUST be declared like this: DWORD WINAPI <name>(LPVOID)
6. In the main body of your application call the function to create and start thread (in our example CreateThread function that actually creates and begins the execution of the thread). See the documentation of your development environment for more details.
7. Wait until all threads are done. Use WaitForMultipleObjects function. Read the help associated to the API call "WaitForMultipleObjects".
8. Close the handles of the threads with the function: CloseHandle.

These steps where followed to create Ex08_PVT example. The example commands 2 Technosoft drives/motors to execute a 2-D motion profile described by a sequence of linear and circular segments. The application uses 2 separate threads for each axis, in which computes the necessary commands for the associated drive. The application requires the multithread variant of the TML_lib, installed by default in the “C:\Program Files\Technosoft\TML_LIB\lib-multithread” folder.

```
#include <windows.h>
HANDLE hThread[2];
DWORD dwThreadId_X, dwThreadId_Y;
```

//You must include <windows.h> for all the Win32 specific thread information.

//An array of handles to threads and of thread id’s must be defined

//Structure for passing to the controlling function
typedef struct _PVT_data_Y {
    long trace_y[N_MAX];
    //You can add here other parameters you might be interested on
    ...}
PVT_DATA_Y, *P_PVT_DATA_Y;

typedef struct _PVT_data_X {
    long trace_x[N_MAX];
    //You can add here other parameters you might be interested on
    ...}
PVT_DATA_X, *P_PVT_DATA_X;

//Global definitions (pointers to the structures defined above)
PVT_DATA_X p_PVT_X;
PVT_DATA_Y p_PVT_Y;

//In Win32, thread functions MUST be declared like this:
//DWORD WINAPI <name>(LPVOID)
//The first thread function

DWORD WINAPI ThreadProc_X( LPVOID lpParam )
{
    //Local definitions for functions parameters
    //Cast to pointer to the structure specific to this controlling function
    P_PVT_DATA_X p_PVT_X;
    p_PVT_X = (P_PVT_DATA_X)lpParam;
    /*Write your specific code for the second thread (first open the
    communication channel, load the setup file from the directory
    created by Easy Setup or Easy Motion, make the setup of the Axis 001
    based on the file previously loaded, make the setup of the Group n,
    make the setup of the broadcast). Be careful in using the same global
    variable in the bought threads */
    //Close the communication channel
    return TRUE;
}

//The second thread function

DWORD WINAPI ThreadProc_Y( LPVOID lpParam )
{
    //Cast to pointer to the structure specific to this controlling function
    P_PVT_DATA_Y p_PVT_Y;
    p_PVT_Y = (P_PVT_DATA_Y)lpParam;
    ...
    return TRUE;
}
int main()
{
/*The thread is created and its execution begin by calling the
CreateThread Win32 API Function. Please read your help files for
more details. */

hThread[0] = CreateThread(
NULL, //default security attributes
0, //use default stack size
ThreadProc_X, // thread function
pp_PVT_X, // argument to thread function
0, // use default creation flags
&dwThreadId_X); // returns the thread identifier

if (hThread[0] == NULL)
{
ExitProcess(0);
}

hThread[1] = CreateThread(NULL,0,ThreadProc_Y,pp_PVT_Y,0,
&dwThreadId_Y)
if (hThread[1] == NULL)
{
ExitProcess(1);
}

//Wait until all threads have terminated.
WaitForMultipleObjects(2, hThread, TRUE, INFINITE);

//Close all thread handles upon completion.
CloseHandle(hThread[0]);
CloseHandle(hThread[1]);

return 0;
}
/*You must include <windows.h> for all the Win32 specific thread
information.*/

#include <windows.h>

//An array of handles to threads and of thread id’s must be defined
HANDLE hThread[2];
DWORD dwThreadId_X, dwThreadId_Y;

//Structure for passing to the controlling function
typedef struct _PVT_data_Y {
    long trace_y[N_MAX];
    //You can add here other parameters you might be interested on
    ...
} PVT_DATA_Y, *P_PVT_DATA_Y;
typedef struct _PVT_data_X {
    long trace_x[N_MAX];
    // You can add here other parameters you might be interested on ...
} PVT_DATA_X, *P_PVT_DATA_X;

// Global definitions (pointers to the structures defined above)
PVT_DATA_X p_PVT_X;
PVT_DATA_Y p_PVT_Y;

// In Win32, thread functions MUST be declared like this:
DWORD WINAPI <name>(LPVOID)
The first thread function*/
DWORD WINAPI ThreadProc_X( LPVOID lpParam )
{
    // Local definitions for functions parameters
    P_PVT_DATA_X p_PVT_X;
    p_PVT_X = (P_PVT_DATA_X)lpParam;
    /* Write your specific code for the second thread (first open the
       communication channel, load the setup file from the directory
       created by Easy Setup or Easy Motion, make the setup of the Axis 001
       based on the file previously loaded, make the setup of the Group n,
       make the setup of the broadcast). Be careful in using the same global
       variable in the bought threads */
    // Close the communication channel
    return TRUE;
}

// The second thread function
DWORD WINAPI ThreadProc_Y( LPVOID lpParam )
{
    // Cast to pointer to the structure specific to this controlling
    function
    P_PVT_DATA_Y p_PVT_Y;
    p_PVT_Y = (P_PVT_DATA_Y)lpParam;
    ...
    return TRUE;
}

Depending on the communication channel used, the TML_LIB can share the communication
resources enabling you to build multiprocess application. The communication devices suited for
multiprocess applications are the serial interfaces (RS232 and RS485) and the CAN interfaces:
• from the Electronic System Design (ESD) – under Linux and Microsoft Windows
• from Peak System – under Linux

3.3 Functions descriptions

The section presents the functions implemented in the TML_LIB library. The functions are classified as follows:
• **Communication setup** – functions that manage the PC communication channel
• **Drive setup** – functions for axis setup in the PC application
• **Drive administration** – functions that control the destination axis of the messages sent from the host
• **Drive/motor monitoring** – functions for monitoring the drive/motor status
• **Error handling** – functions for FAULT state reset and drive reset
• **Motion programming** – functions for motion programming on the selected axis.
• **Motor commands** – functions to enable/disable the motor power stage, start/stop the motion, change the value of the motor position and current
• **Events** – functions for events programming and test
• **TML jumps and function calls** – functions which allows you to execute code downloaded in the drive/motor memory
• **I/O handling** – functions for read/write operations with drive/motor I/O ports
• **Data transfer** – functions for read/write operations from/to the drive/motor memory
• **Miscellaneous** – functions to send individual TML commands and to view the binary code of a TML command
• **Data logger** – functions for logger setup and data upload

For each function you will find the following information:
• The C prototype
• Description of the arguments
• A functional description
• Name of related functions
• Examples reference. The examples are listed in chapter 4.
3.3.1 Communication setup

3.3.1.1 TS_OpenChannel

Prototype:

INT TML_EXPORT TS_OpenChannel(LPCSTR pszDevName, BYTE btType, BYTE nHostID, DWORD baudrate);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pszDevName</td>
<td>The communication channel to be opened</td>
</tr>
<tr>
<td>btType</td>
<td>The type of the communication channel and the CAN-bus communication protocol</td>
</tr>
<tr>
<td>nHostID</td>
<td>Axis ID for the PC</td>
</tr>
<tr>
<td>Baudrate</td>
<td>Communication baud rate</td>
</tr>
<tr>
<td>Return</td>
<td>The file descriptor of the or -1 if error</td>
</tr>
</tbody>
</table>

Description: The function opens the communication channel specified with parameter `pszDevName`.

The `btType` parameter specifies the communication channel type and the CAN-bus communication protocol used by the application. `btType = ChannelType | ProtocolType`.

The TML_LIB supports the following types of communication channels:

- **serial RS-232**
  - `ChannelType = CHANNEL_RS232` for PC serial port
  - `ChannelType = CHANNEL_VIRTUAL_SERIAL` for communication through a user implemented serial driver. To properly interface the serial driver with the tmlcomm.dll, the user must follow the next steps:
    a. Initialize the communication channel with the serial settings implemented on the Technosoft drives/motors: 8 data bits, 2 stop bits, no parity, no flow control and one of the following baud rates: 9600 (default after reset), 19200, 38400, 56600 and 115200.
    b. Implement the functions for interfacing the custom communication driver with the tmlcomm.dll. See the virtRS232.cpp file from the virtRS232 example project.
    c. Export the functions from the communication driver using a module-definition (.DEF) file. See the virtRS232.def file from the virtRS232 example project.

- **serial RS-485**
  - `ChannelType = CHANNEL_RS485` for an RS-485 interface board or an RS-232/RS-485 converter

- **CAN-bus devices supported by TML_LIB for Microsoft Windows**
  - `ChannelType = CHANNEL_IXXAT_CAN` for IXXAT PC to CAN interface
  - `ChannelType = CHANNEL_SYS_TEC_USB_CAN` for Sys Tec USB to CAN interface
- ChannelType = CHANNEL_ESD_CAN for ESD CAN interfaces
- ChannelType = CHANNEL_LAWICEL_USBCAN for Lawicel CAN interface
- ChannelType = CHANNEL_PEAK_SYS_PCIE_CAN for PEAK System PC/PCI to CAN interface
- ChannelType = CHANNEL_PEAK_SYS_PCIE_CAN104 for PEAK System PC/104
- ChannelType = CHANNEL_PEAK_SYS_PCIE_USB for PEAK System USB to CAN interface
- ChannelType = CHANNEL_PEAK_SYS_PCIE_DONGLE for PEAK System Dongle interfaces

- CAN-bus devices supported by TML_LIB for Linux
  - ChannelType = CHANNEL_RXXAT_CAN for IXXAT CAN interfaces supported by the Basic CAN interface from IXXAT
  - ChannelType = CHANNEL_ESD_CAN for ESD CAN interfaces
  - ChannelType = CHANNEL_PEAK_SYS_PCIE_CAN for PEAK System PCAN-ISA
  - ChannelType = CHANNEL_PEAK_SYS_PCIE_CAN104 for PEAK System PC/104
  - ChannelType = CHANNEL_PEAK_SYS_PCIE_USB for PEAK System USB interface
  - ChannelType = CHANNEL_PEAK_SYS_PCIE_PCI for PEAK System PCI interface

Remarks:

1. The drivers for Peak System interface must be installed with NO_NDEV_SUPPORT option. The `cat /proc/pcan` command can be used to check if the NDEV support is disabled.

2. The TML_lib for Linux package contains a patch for drivers of the CAN-bus interfaces from PEAK System which enables the hardware filtering of the CAN messages. After TML_LIB installation, apply the patch, compile and install the driver using the drivers' documentation.

- Ethernet
  - ChannelType = CHANNEL_XPORT_IP for Technosoft Ethernet to RS232 adapter
  - ChannelType = CHANNEL_ETHERNET_CAN for Technosoft Ethernet to CAN adapter

1 Supported only in the TML_LIB for Microsoft Windows
The CAN-bus communication protocols supported by the TML_LIB are:

- **ProtocolType = PROTOCOL_TMLCAN** – 29-bit CAN identifier
- **ProtocolType = PROTOCOL_TECHNOCAN** – 11-bit CAN identifier

**Remarks:**

1. By default the TML_LIB uses the TMLCAN communication protocol, thus if your drive/motor supports only TMLCAN protocol then the `btType = ChannelType`.
2. The specification of CAN-bus protocol is required when the PC is connected directly to the CAN-bus through a PC to CAN interface or in the cases when the drive/motor connected to the PC via RS232/Ethernet acts as a retransmission relay between the PC and the CAN-bus network. More details about the retransmission relay concept can be found in EasyMotion Studio on line help.

Depending on the communication channel type, the parameter `pszDevName` can be:

- For serial communication:
  - ‘COM1’, ‘COM2’, ‘COM3’… for Microsoft Windows version
  - ‘/dev/ttyS0’, ‘/dev/ttyS1’, ‘/dev/ttyS3’ for Linux version
- For virtual serial interface is the name of the dll file that implements the serial interface
- For CAN-bus communication:
  - ‘1’, ‘2’, ‘3’… for Microsoft Windows version
  - ‘/dev/pcan0’, ‘/dev/pcan8’ for Linux version
- For Ethernet communication: ‘192.168.19.52’, …

The `nHostID` parameter represents the Axis ID of the PC in the system. The value of `nHostId` is set as follows:

- For serial RS-232 the `nHostID` is equal with the axis ID of the drive connected to the PC serial port
- For serial RS-485 and CAN-bus the `nHostID` must be a unique value. **Attention! Make sure that all the drives/motors from the network have unique address.**
- For Ethernet to RS232 adapter the `nHostID` is equal with the axis ID of the drive connected to the serial port of the Ethernet adapter.
- For Ethernet to CAN adapter the `nHostID` is equal with the axis ID assigned to the Ethernet to CAN adapter via the Ethernet-CAN Adapter Configurator software.

Set the communication speed with the `BaudRate` parameter. The accepted values are:

- For serial communication and Ethernet to RS232: 9600, 19200, 38400, 56000 or 115200 bps.
- For CAN-bus and Ethernet to CAN: 125000, 250000, 500000, 1000000 bps

**Remark:** You can open several communication channels but only one can be active in an application at one moment. You can switch between the communication channels with function `TS_SelectChannel`.

**Related functions:** `TS_CloseChannel`, `TS_SelectChannel`

**Associated examples:** all
3.3.1.2 TS_SelectChannel

Prototype:

BOOL TML_EXPORT TS_SelectChannel(INT fd);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd</td>
<td>The communication channel file descriptor</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function selects as active the communication channel described by parameter fd. All commands send towards the drives/motors will use the selected communication channel.

Remarks:

1. Use function TS_OpenChannel to open the communication channels
2. The function TS_SelectChannel is not required in applications with only one communication channel

Related functions: TS_OpenChannel, TS_CloseChannel

Associated examples: –
3.3.1.3  TS_CloseChannel

Prototype:

void TML_EXPORT TS_CloseChannel(INT fd);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd</td>
<td>The communication channel file descriptor</td>
</tr>
<tr>
<td>–</td>
<td>–</td>
</tr>
</tbody>
</table>

Description: The function closes the communication channel described by parameter `fd`. With `fd = -1` the function closes the channel previously selected with function `TS_SelectChannel`. This function must be called at the end of the application. It will release the communication channel resources, as it was allocated to the program when the `TS_OpenChannel` function was called.

Related functions: `TS_OpenChannel`, `TS_SelectChannel`

Associated examples: all
3.3.2 Drive setup

3.3.2.1 TS_LoadSetup

Prototype:

INT TML_EXPORT TS_LoadSetup(LPCSTR setupDirectory);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setupDirectory</td>
<td>The setup description file (t.zip) to be loaded in the TML_lib application</td>
</tr>
<tr>
<td>return</td>
<td>The index associated to the setup</td>
</tr>
</tbody>
</table>

Description: The function loads the description of the drive/motor that will be controlled from the PC application. The description of the drive/motor configuration is generated from EasyMotion Studio (Application | Export to TML_lib…) or EasySetUp (Setup | Export to TML_lib…) and stored in a zip file with t.zip extension.

The setupDirectory string specifies the absolute or relative path of the t.zip file. The function returns an index associated to the configuration setup. The value returned by TS_LoadSetup must be used to associate the configuration setup with the corresponding axis.

Remark: The function must be called for each drive/motor only once in your program, in the initialization part.

Related functions: TS_SetupAxis, TS_SetupGroup, TS_SetupBroadcast

Associated examples: all
3.3.2.2 TS_SetupAxis

Prototype:

```c
BOOL TML_EXPORT TS_SetupAxis(BYTE axisID, INT idxSetup);
```

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>axisID</td>
<td>AxisID of the drive/motor</td>
</tr>
<tr>
<td>idxSetup</td>
<td>Configuration description index generated by TS_LoadSetup</td>
</tr>
</tbody>
</table>

Output

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function links a configuration description (t.zip file) to an axisID address. The configuration description is identified through idxSetup.

The function must be called for each axis of the motion system, only once in your program, in the initialization part, before any attempt to send messages to that axis.

Remarks:

1. The axisID address must be identical with the value set for the drive/motor in Drive Setup dialog from EasySetUp or EasyMotion Studio.
2. Use function TS_LoadSetup to load the configuration description files (t.zip) for each axis and generate the index.

Related functions: TS_LoadSetup, TS_SetupGroup, TS_SetupBroadcast

Associated examples: all
3.3.2.3 TS_SetupGroup

Prototype:

BOOL TML_EXPORT TS_SetupGroup(BYTE groupId, INT idxSetup);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupId</td>
<td>Group ID number. It must be a value between 1 and 8</td>
</tr>
<tr>
<td>idxSetup</td>
<td>Name of the data file storing the setup axis information</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function links the group of drives/motors with a configuration description file (t.zip) identified through idxSetup. The configuration description is used by TML_LIB when sends group commands.

The function must be called for each group defined in the motion system, only once in your program, in the initialization part, before any attempt to send messages to that group.

Remarks: Use function TS_LoadSetup to generate the identifier of the configuration description file.

Related functions: TS_LoadSetup, TS_SetupAxis, TS_SetupBroadcast

Associated examples: –
3.3.2.4 TS_SetupBroadcast

Prototype:

BOOL TML_EXPORT TS_SetupBroadcast(INT idxSetup);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>idxSetup</td>
<td>Name of the data file storing the setup axis information</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function sets the configuration description file to be used by TML_LIB when issuing broadcast commands. The configuration setup is identified through idxSetup.

Remarks: Use function TS_LoadSetup to generate the identifier of the configuration description file.

Related functions: TS_LoadSetup, TS_SetupAxis, TS_SetupGroup

Associated examples: Ex07_MultiAxes
3.3.2.5  TS_DriveInitialisation

Prototype:

`BOOL TML_EXPORT TS_DriveInitialisation(void);`

Arguments:

<table>
<thead>
<tr>
<th>Input/Output</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>–</td>
<td>–</td>
</tr>
<tr>
<td>Output</td>
<td>Return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function initializes the active axis. It must be executed when the drive/motor is powered or after a reset with function TS_Reset. The function call should be placed after the functions TS_SetupAxis and TS_SelectAxis and before any functions that send messages to the axis.

If the setup table from the active axis is invalid the function will fail and a valid setup table must be downloaded from EasySetUp or EasyMotion Studio. The new setup table becomes active once the drive is reset or power cycled.

Related functions: TS_LoadSetup, TS_SetupAxis, TS_SelectAxis

Associated examples: all
3.3.2.6 TS_Save

Prototype:

BOOL TML_EXPORT TS_Save(void);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>–</td>
</tr>
<tr>
<td>Output</td>
<td>return</td>
</tr>
</tbody>
</table>

Description: The function saves the actual values of all the TML parameters with setup data from the active data RAM memory into the non-volatile memory, in the setup table. Through this command, you can save the parameters modifications done after the power on initialization.

Related functions: TS_Reset, TS_Save

Associated examples: –
3.3.3 Drive administration

3.3.3.1 TS_SelectAxis

Prototype:

BOOL TML_EXPORT TS_SelectAxis(BYTE axisID);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>axisID</td>
<td>The axis ID where the commands are sent</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function selects the currently active axis. All further function calls, which send TML messages over the communication channel, will address the messages to the active axis.

The function can be called once the configuration of the axis is completed (after calling the TS_SetupAxis function to link a configuration description file with the axisID).

For single axis motion system, the function must be called only once. In case of a multiple axis application, the TS_SelectAxis must be called each time you want to redirect the communication to another axis of the system.

Related functions: TS_SelectGroup, TS_SelectBroadcast

Associated examples: all
### 3.3.3.2 TS_SelectGroup

**Prototype:**

```c
BOOL TML_EXPORT TS_SelectGroup(BYTE groupID);
```

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupID</td>
<td>The group ID where the commands are sent</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

**Description:** The function selects the currently active group. All further function calls, which send TML messages over the communication channel, will address these messages to this active group. The active group is set with parameter `groupID`. It must be a value between 1 and 8.

**Remark:** *The function must be called after the group setup i.e. after calling the `TS_SetupGroup` function.*

**Related functions:** TS_SelectAxis, TS_SelectBroadcast

**Associated examples:** Ex08_PVT
3.3.3.3  TS_SelectBroadcast

Prototype:

BOOL TML_EXPORT TS_SelectBroadcast(void);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>–</td>
</tr>
<tr>
<td>Output</td>
<td>return: TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function enables TML_LIB to issue the broadcast messages, i.e. all further function calls, which send TML messages on the communication channel, will address these messages to all the axes.

Remark: The function must be called after the broadcast setup i.e. after calling the TS_SetupBroadcast function.

Related functions: TS_SelectAxis, TS_SelectGroup

Associated examples: Ex07_MultiAxes
3.3.4 Drive/motor monitoring

3.3.4.1 TS_ReadStatus

Prototype:

`BOOL TML_EXPORT TS_ReadStatus(SHORT SelIndex, WORD& Status);`

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td></td>
</tr>
<tr>
<td>SelIndex</td>
<td>Registers selection index</td>
</tr>
<tr>
<td>Status</td>
<td>Pointer of the variable where the status is saved</td>
</tr>
<tr>
<td>Output</td>
<td></td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error; FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function returns drive/motor status information. Depending on the value of `SelIndex` parameter, you can examine the contents of the Motion Control Register (`SelIndex = REG_MCR`), Motion Status Register (`SelIndex = REG_MSR`), Interrupt Status Register (`SelIndex = REG_ISR`), Status Register Low (`SelIndex = REG_SRL`), Status Register High (`SelIndex = REG_SRH`) or Motion Error Register (`SelIndex = REG_MER`) of the drive/motor.

Related functions: –

Associated examples: Ex02_DriveStatus, Ex03_ErrorHandling
3.3.4.2 TS_GetFirmwareVersion

Prototype:

BOOL TML_EXPORT TS_GetFirmwareVersion (BYTE szFWVersion);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>szFWVersion</td>
<td>Specifies the char array where the firmware version will be stored</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function requests the firmware version from the active axis. The firmware version is codified with 5 characters. The ASCII code of the characters will be stored in the szFWVersion array.

Related functions: –

Associated examples: Ex02_DriveStatus
3.3.4.3 TS_GetApplicationInfo

BOOL TML_EXPORT TS_GetApplicationInfo(LPSTR pszOutput);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pszOutput</td>
<td>Pointer to a string where Application ID will be saved</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

**Description:** The function returns the Application ID string from the configuration description file (*.t.zip) generated with EasyMotion Studio/EasySetUp.

The Application ID string can be set via the Drive Info dialog from Drive Setup. The Application ID string can have up to 30 characters and it can be used to identify the setup/application stored in the non-volatile memory of the drive.

The Application ID stored in the non-volatile memory of the drive can be retrieved with TS_GetBuffer function.

**Related functions:** –

**Associated examples:** Ex02_DriveStatus
3.3.4.4 TS_SendDataToHost

Prototype:

BOOL TML_EXPORT TS_SendDataToHost(BYTE HostAddress, DWORD StatusRegMask, WORD ErrorRegMask);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HostAddress</td>
<td>The Axis ID of the host where the messages are sent</td>
</tr>
<tr>
<td>StatusRegMask</td>
<td>Specifies the bits from status register that trigger the message</td>
</tr>
<tr>
<td>ErrorRegMask</td>
<td>Specifies the bits from error register that trigger the message</td>
</tr>
</tbody>
</table>

Description: The function enables the active axis to send messages automatically to the host. The messages are triggered by conditions that change the drive/motor status or the error register. The conditions are set through parameters StatusRegMask and ErrorRegMask. The host Axis ID is set with parameter HostAddress.

Related functions: TS_RegisterHandlerForUnrequestedDriveMessages, TS_CheckForUnrequestedDriveMessages

Associated examples: Ex02_DriveStatus
3.3.4.5  TS_CheckForUnrequestedDriveMessages

Prototype:

BOOL TML_EXPORT TS_CheckForUnrequestedDriveMessages(void);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>–</td>
<td>–</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function checks if there are new unrequested messages received from the drive/motor. If the communication buffer contains an unrequested message then it calls the user callback function that handles this type of messages. The TS_CheckForUnrequestedDriveMessages function should be called periodically to ensure that the latest information is used in the application.

Related functions: TS_RegisterHandlerForUnrequestedDriveMessages, TS_SendDataToHost

Associated examples: Ex02_DriveStatus
3.3.4.6 TS_RegisterHandlerForUnrequestedDriveMessages

Prototype:

```c
void TML_EXPORT TS_RegisterHandlerForUnrequestedDriveMessages
(pfnCallbackRecvDriveMsg handler);
```

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pfnCallbackRecvDriveMsg</td>
<td>Pointer to the user function</td>
</tr>
</tbody>
</table>

Description: The function registers the user callback function that handles the unrequested messages sent by the drive/motor.

Related functions: TS_CheckForUnrequestedDriveMessages, TS_SendDataToHost

Associated examples: Ex02_DriveStatus
3.3.4.7 TS_OnlineChecksum

Prototype:

BOOL TML_EXPORT TS_OnlineChecksum(WORD startAddress, WORD endAddress WORD &checksum);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startAddress</td>
<td>The memory range start address</td>
</tr>
<tr>
<td>endAddress</td>
<td>The memory range end address</td>
</tr>
<tr>
<td>checksum</td>
<td>Pointer to the variable where the checksum is stored</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function requests from the active axis the checksum of a memory range. The memory range is defined with parameters `startAddress` and `endAddress`. The function stores the checksum received from the drive in the `checksum` variable.

The TS_OnlineChecksum function can be used to check the integrity of the data saved in the non-volatile or RAM memory of a drive/motor. The memory type is selected automatically function of the `startAddress` and the `endAddress`.

Related functions: TS_SetBuffer

Associated examples: --
3.3.5 Error handling

3.3.5.1 TS_ResetFault

Prototype:

BOOL TML_EXPORT TS_ResetFault(void);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>–</td>
</tr>
<tr>
<td>Output</td>
<td>return</td>
</tr>
</tbody>
</table>

Description: The function resets the FAULT state on the active axis. A drive/motor enters in fault state when detects an error. Following the TS_ResetFault execution, most of the errors bits from Motion Error Register are cleared (set to 0), the Ready output (if present) is set to the ready level, the Error output (if present) is set to the no error level and the drive/motor returns to normal operation.

Remarks:
- The TS_ResetFault execution does not change the status of MER.15 (enable input on disabled level), MER.7 (negative limit switch input active), MER.6 (positive limit switch input active) and MER.2 (invalid setup table)
- The drive/motor will return to FAULT status if there are errors when the function is executed

Related functions: TS_Power, TS_ReadStatus

Associated examples: Ex03_ErrorHandling
3.3.5.2 TS_Reset

Prototype:

BOOL TML_EXPORT TS_Reset(void);

Arguments:

<table>
<thead>
<tr>
<th>Input</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>return</td>
<td>return</td>
<td>TRUE if no error; FALSE if error</td>
</tr>
</tbody>
</table>

**Description:** The function resets the active axis. After reset the drive/motor will load the values of the TML parameters set during setup phase. If the drive/motor is configured to run in the ‘Autorun’ mode, after reset, it will automatically execute the TML code stored in the E2ROM memory (if there is such a program).

**Remark:** If during drive/motor operation you have changed the setup parameters and want to use them after the reset, call function TS_Save prior TS_Reset. The function TS_Save stores the actual values of all TML parameters in the drive's/motor's non-volatile memory.

**Related functions:** TS_DriveInitialization, TS_Power, TS_DownloadProgram, TS_GOTO, TS_Save

3.3.6 Motion programming

3.3.6.1 TS_MoveAbsolute

Prototype:

BOOL TML_EXPORT TS_MoveAbsolute(LONG AbsPosition, DOUBLE Speed, double Acceleration, SHORT MoveMoment, SHORT ReferenceBase);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AbsPosition</td>
<td>Position to reached expressed in TML position units</td>
</tr>
<tr>
<td>Speed</td>
<td>Slew speed expressed in TML speed units. If the value is zero the drive/motor will use the previously value set for speed</td>
</tr>
<tr>
<td>Acceleration</td>
<td>Acceleration/deceleration rate expressed in TML acceleration units. If its value is zero the drive/motor will use the previously value set for acceleration</td>
</tr>
<tr>
<td>MoveMoment</td>
<td>Defines the moment when the motion is started</td>
</tr>
<tr>
<td>ReferenceBase</td>
<td>Specifies how the motion reference is computed: from actual values of position and speed reference or from actual values of load/motor position and speed</td>
</tr>
</tbody>
</table>

Description: The function programs an absolute positioning with trapezoidal speed profile. The motion is described through AbsPosition parameter for position to reach, Speed for slew speed and Acceleration for acceleration/deceleration rate. The position to reach can be positive or negative. The Speed and Acceleration can be only positive.

Once set, the motion parameters are memorized on the drive/motor. If you intend to use values previously defined for the acceleration rate and/or the velocity you don’t need to send their values again in the following trapezoidal profiles. Set to zero the value of speed and/or acceleration and the drive/motor will use the values previously defined (this option reduces the TML code generated by this function).

The motion is executed:

- Immediately when MoveMoment = UPDATE_IMMEDIATE
- When a programmed event occurs if MoveMoment = UPDATE_ON_EVENT
- If you select MoveMoment = UPDATE_NONE, the movement is parameterized, but does not execute. You’ll need to issue an update command to determine the execution of the movement. Use the TS_UpdateImmediate or the TS_UpdateOnEvent functions in order to activate the movement.

Set ReferenceBase = FROM_REFERENCE if you want the reference generator to compute the motion profile starting from the actual values of the position and speed reference. Set ReferenceBase = FROM_MEASURE if you want the reference generator to compute the motion profile starting from the actual values of the load/motor position and speed. When this option is used, at the beginning of each new motion profile, the position and speed reference are updated with the actual values of the load/motor position and speed.
Remark: For stepper open loop configurations the ReferenceBase option is ignored because there is no position feedback.

Associated examples: Ex05_Homing, Ex07_MultiAxes, Ex11_IOHandling
3.3.6.2 TS_MoveRelative

Prototype:

BOOL TML_EXPORT TS_MoveRelative(LONG RelPosition, DOUBLE Speed, DOUBLE Acceleration, BOOL IsAdditive, SHORT MoveMoment, SHORT ReferenceBase);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RelPosition</td>
<td>Position increment expressed in TML position units</td>
</tr>
<tr>
<td>Speed</td>
<td>Slew speed expressed in TML speed units. If its value is zero the drive/motor will use the previously value set for speed</td>
</tr>
<tr>
<td>Acceleration</td>
<td>Acceleration/deceleration rate expressed in the TML acceleration units. If its value is zero the drive/motor will use the previously value set for acceleration</td>
</tr>
<tr>
<td>IsAdditive</td>
<td>Specifies how is computed the position to reach</td>
</tr>
<tr>
<td>MoveMoment</td>
<td>Defines the moment when the motion is started</td>
</tr>
<tr>
<td>ReferenceBase</td>
<td>Specifies how the motion reference is computed: from actual values of position and speed reference or from actual values of load/motor position and speed</td>
</tr>
</tbody>
</table>

Description: The function programs a relative positioning with trapezoidal speed profile. The motion is described through `RelPosition` for position increment, `Acceleration` for acceleration/deceleration rate and `Speed` for slew speed. The position increment can be positive or negative; the sign gives the motion direction. The speed and acceleration can be only positive.

Once set, the motion parameters are memorized on the drive/motor. If you intend to use values previously defined for the acceleration rate and/or the velocity you don’t need to send their values again in the following trapezoidal profiles. Set to zero the value of speed and/or acceleration if you want the drive/motor to use the values previously defined with other commands (this option reduces the TML code generated by this function).

The position to reach can be computed in 2 ways: standard (default) or additive. In standard mode, the position to reach is computed by adding the position increment to the instantaneous position in the moment when the command is executed. In the additive mode, the position to reach is computed by adding the position increment to the previous position to reach, independently of the moment when the command was issued. The additive mode is activated with `IsAdditive = TRUE`.

The motion is executed:

- Immediately when `MoveMoment = UPDATE_IMMEDIATE`
- When a programmed event occurs if `MoveMoment = UPDATE_ON_EVENT`
- If you select `MoveMoment = UPDATE_NONE`, the movement is parameterized, but does not execute. You’ll need to issue an update command to determine the execution of the movement. Use the `TS_UpdateImmediate` or the `TS_UpdateOnEvent` functions in order to activate the movement.

Set `ReferenceBase = FROM_REFERENCE` if you want the reference generator to compute the motion profile starting from the actual values of the position and speed reference. Use this option
for example if successive standard relative moves must be executed and the final target position should represent exactly the sum of the individual commands. Set **ReferenceBase = FROM_MEASURE** if you want the reference generator to compute the motion profile starting from the actual values of the load/motor position and speed. When this option is used, at the beginning of each new motion profile, the position and speed reference are updated with the actual values of the load/motor position and speed.

**Remark:** For stepper open loop configurations the ReferenceBase option is ignored because there is no position feedback.

**Related functions:** TS_MoveAbsolute, TS_MoveSCurveAbsolute, TS_MoveSCurveRelative, TS_MoveVelocity

**Associated examples:** Ex02_DriveStatus, Ex04_BasicMove, Ex05_Homing, Ex09_Logger, Ex10_EventHandling, Ex11_IOHandling
3.3.6.3  TS_MoveSCurveAbsolute

Prototype:

BOOL TML_EXPORT TS_MoveSCurveAbsolute(LONG AbsPosition, DOUBLE Speed, DOUBLE Acceleration, LONG JerkTime, SHORT MoveMoment, SHORT DecelerationType);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AbsPosition</td>
<td>Position to reach expressed in TML position units</td>
</tr>
<tr>
<td>Speed</td>
<td>The slew speed expressed in TML speed units</td>
</tr>
<tr>
<td>Acceleration</td>
<td>Acceleration/deceleration rate expressed in TML acceleration units.</td>
</tr>
<tr>
<td>JerkTime</td>
<td>Represents the time interval for acceleration to reach the programmed value. It is expressed in TML time units.</td>
</tr>
<tr>
<td>MoveMoment</td>
<td>Defines the moment when the motion is started</td>
</tr>
<tr>
<td>DecelerationType</td>
<td>Specifies the speed profile used when the motion is stopped with TS_Stop</td>
</tr>
</tbody>
</table>

Description: The function block programs an absolute positioning with an S-curve shape of the speed. This shape is due to the jerk limitation, leading to a trapezoidal or triangular profile for the acceleration and an S-curve profile for the speed. The motion is described through AbsPosition parameter for position to reach, Speed for slew speed, Acceleration for acceleration/deceleration rate and JerkTime. The position to reach can be positive or negative. The Speed, Acceleration and JerkTime can be only positive.

An S-curve profile must begin when load/motor is not moving. During motion the parameters should not be changed. Therefore when executing successive S-curve commands, you should wait for the previous motion to end before setting the new motion parameters and starting next motion.

When the motion is stopped with function TS_Stop, the deceleration phase can be done in 2 ways:

- Smooth, using an S-curve speed profile, when DecelerationType = S_CURVE_SPEED_PROFILE
- Fast, using a trapezoidal speed profile, when DecelerationType = TRAPEZOIDAL_SPEED_PROFILE

The motion can be executed:

- Immediately when MoveMoment = UPDATE_IMMEDIATE
- When a programmed event occurs if MoveMoment = UPDATE_ON_EVENT
- If you select MoveMoment = UPDATE_NONE, the movement is parameterized, but does not execute. You’ll need to issue an update command to determine the execution of the movement. Use the TS_UpdateImmediate or the TS_UpdateOnEvent functions in order to activate the movement.

</tbody>
</table>

Output

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function programs a trapezoidal speed profile. You specify the jog Speed. The load/motor accelerates until the jog speed is reached. The jog speed can be positive or negative; the sign gives the direction. The Acceleration can be only positive.

Once set, the motion parameters are memorized on the drive/motor. If you intend to use values previously defined for the acceleration rate you don’t need to send its value again in the following speed profiles. Set to zero the value of acceleration if you want the drive/motor to use the value previously defined with other commands (this option reduces the TML code generated by this function).

The motion is executed:

- Immediately when MoveMoment = UPDATE_IMMEDIATE
- When a programmed event occurs if MoveMoment = UPDATE_ON_EVENT
- If you select MoveMoment = UPDATE_NONE, the movement is parameterized, but does not execute. You'll need to issue an update command to determine the execution of the movement. Use the TS_UpdateImmediate or the TS_UpdateOnEvent functions in order to activate the movement.

Set ReferenceBase = FROM_REFERENCE if you want the reference generator to compute the motion profile starting from the actual values of the position and speed reference. Use this option for example if successive standard relative moves must be executed and the final target position should represent exactly the sum of the individual commands. Set ReferenceBase = FROM_MEASURE if you want the reference generator to compute the motion profile starting from the actual values of the load/motor position and speed. When this option is used, at the beginning of each new motion profile, the position and speed reference are updated with the actual values of the load/motor position and speed.

Remark: In open loop control of steppers, this option is ignored because there is no position and/or speed feedback.

Related functions: TS_MoveRelative, TS_MoveAbsolute, TS_MoveSCurveAbsolute, TS_MoveSCurveRelative
Associated examples: Ex04_BasicMove, Ex06_ExternalReference, Ex07_MultiAxes, Ex10_EventHandling, Ex11_IOHandling
3.3.6.6  TS_SetAnalogueMoveExternal

Prototype:

BOOL TML_EXPORT TS_SetAnalogueMoveExternal(SHORT ReferenceType, BOOL UpdateFast, DOUBLE LimitVariation, SHORT MoveMoment);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ReferenceType</td>
<td>Specifies how the analogue signal is interpreted</td>
</tr>
<tr>
<td>UpdateFast</td>
<td>Specifies how often the analogue reference is read when torque control is performed</td>
</tr>
<tr>
<td>LimitVariation</td>
<td>Speed/acceleration limit value for position/speed control expressed in TML internal units</td>
</tr>
<tr>
<td>MoveMoment</td>
<td>Defines the moment when the motion is started</td>
</tr>
</tbody>
</table>

Description: The function block programs the drive/motor to work with an external analogue reference read via a dedicated analogue input (10-bit resolution). The analogue signal can be interpreted as a position, speed or torque analogue reference. Through parameter ReferenceType you specify how the analogue signal is interpreted:

- Position reference when ReferenceType = REFERENCE_POSITION. The drive/motor performs position control.
- Speed reference when ReferenceType = REFERENCE_SPEED. The drive/motor performs speed control.
- Torque reference when ReferenceType = REFERENCE_TORQUE. The drive/motor performs torque control.

Remark: During the drive/motor setup, in the Drive setup dialogue, you have to:

1. Select the appropriate control type for your application at Control Mode.
2. Perform the tuning of controllers associated with the selected control mode.
3. Setup the analogue reference. You specify the reference values corresponding to the upper and lower limits of the analogue input. In addition, a dead-band symmetrical interval and its center point inside the analogue input range may be defined.

In position control you can limit the maximum speed at sudden changes of the position reference and thus to reduce the mechanical shocks. In speed control you can limit the maximum acceleration at sudden changes of the speed reference and thus to get a smoother transition. These features are activated by setting the LimitVariation parameter to a positive value and disabled when the LimitVariation is zero.

In torque control you can choose how often to read the analogue input: at each slow loop sampling period (UpdateFast = TRUE) or at each fast loop sampling period (UpdateFast = FALSE).

The motion is executed:

- Immediately when MoveMoment = UPDATE_IMMEDIATE
- When a programmed event occurs if MoveMoment = UPDATE_ON_EVENT
- If you select MoveMoment = UPDATE_NONE, the motion parameters are set, but does not execute. You'll need to issue an update command to determine the execution of the
movement. Use the **TS_UpdateImmediate** or the **TS_UpdateOnEvent** functions in order to activate the movement.

**Related functions:** TS_SetDigitalMoveExternal, TS_SetOnlineMoveExternal

**Associated examples:** Ex06_ExternalReference
3.3.6.7  TS_SetDigitalMoveExternal

Prototype:

BOOL TML_EXPORT TS_SetDigitalMoveExternal(BOOL SetGearRatio, SHORT Denominator, SHORT Numerator, DOUBLE LimitVariation, SHORT MoveMoment);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SetGearRatio</td>
<td>Specifies if the digital reference is followed by the drive with a gear ratio</td>
</tr>
<tr>
<td>Denominator</td>
<td>Gear ratio denominator</td>
</tr>
<tr>
<td>Numerator</td>
<td>Gear ratio numerator</td>
</tr>
<tr>
<td>LimitVariation</td>
<td>Acceleration limit value</td>
</tr>
<tr>
<td>MoveMoment</td>
<td>Defines the moment when the motion is started</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function block programs the drive/motor to work with an external digital reference provided as pulse & direction or quadrature encoder signals. In either case, the drive/motor performs a position control with the reference computed from the external signals.

Remarks: The option for the input signals: pulse & direction or quadrature encoder is established during the drive/motor setup.

The drive/motor follows the external reference with a gear ratio different than 1:1 when SetGearRatio = TRUE. The gear ratio is specified as a ratio of 2 integer values: Numerator / Denominator. The Numerator value is signed, while the Denominator is unsigned. The sign indicates the direction of movement: positive – same as the external reference, negative – reversed to the external reference.

You can limit the maximum acceleration at sudden changes of the external reference and thus to get a smoother transition. This feature is activated when the parameter LimitValue has a positive value and disabled when its value is zero.

The motion is executed:

- Immediately when MoveMoment = UPDATE_IMMEDIATE
- When a programmed event occurs if MoveMoment = UPDATE_ON_EVENT
- If you select MoveMoment = UPDATE_NONE, the motion parameters are set, but the motion is not activated. You'll need to issue an update command to determine the execution of the movement. Use the TS_UpdateImmediate or the TS_UpdateOnEvent functions in order to activate the movement.

Related functions: TS_SetAnalogueMoveExternal, TS_SetOnlineMoveExternal

Associated examples: Ex06_ExternalReference
3.3.6.8  TS_SetOnlineMoveExternal

Prototype:

BOOL TML_EXPORT TS_SetOnlineMoveExternal(SHORT ReferenceType, DOUBLE LimitVariation, DOUBLE InitialValue, SHORT MoveMoment);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ReferenceType</td>
<td>Specifies how the analogue signal is interpreted</td>
</tr>
<tr>
<td>LimitVariation</td>
<td>Speed/acceleration limit value for position/speed control expressed in TML internal units</td>
</tr>
<tr>
<td>InitialValue</td>
<td>The initial value of the reference received on-line</td>
</tr>
<tr>
<td>MoveMoment</td>
<td>Defines the moment when the motion is started</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function programs the drive/motor to work with a reference received via a communication channel from an external device. Depending on the control mode chosen, the external reference is saved in one of the TML variables:

- EREFP, which becomes the position reference if the ReferenceType = REFERENCE_POSITION
- EREFS, which becomes the speed reference if the ReferenceType = REFERENCE_SPEED
- EREFT, which becomes the torque reference if the ReferenceType = REFERENCE_TORQUE
- EREFV, which becomes voltage reference if the ReferenceType = REFERENCE_VOLTAGE

Remark: During the drive/motor setup, in the Drive setup dialogue, you have to:

1. Select the appropriate control type for your application in Drive Setup dialogue.
2. Perform the tuning of controllers associated with the selected control mode.

In position control you can limit the maximum speed at sudden changes of the position reference and thus to reduce the mechanical shocks. In speed control you can limit the maximum acceleration at sudden changes of the speed reference and thus to get a smoother transition. These features are activated by setting the LimitVariation parameter to a positive value and disabled when the LimitVariation is zero.

The motion is executed:

- Immediately when MoveMoment = UPDATE_IMMEDIATE
- When a programmed event occurs if MoveMoment = UPDATE_ON_EVENT
- If you select MoveMoment = UPDATE_NONE, the movement is parameterized, but does not execute. You'll need to issue an update command to determine the execution of the movement. Use the TS_UpdateImmediate or the TS_UpdateOnEvent functions in order to activate the movement.
If the external device starts sending the reference AFTER the motion mode is activated, it may be necessary to initialize EREFP, EREFS, EREFT or EREFV. The desired starting value is set through InitialValue parameter.

**Related functions:**  TS_SetAnalogueMoveExternal, TS_SetDigitalMoveExternal

**Associated examples:**  Ex06_ExternalReference
3.3.6.9 TS_VoltageTestMode

Prototype:

```c
BOOL TML_EXPORT TS_VoltageTestMode(SHORT MaxVoltage, SHORT IncrVoltage, SHORT Theta0, SHORT Dtheta, SHORT MoveMoment);
```

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MaxVoltage</td>
<td>Maximum test voltage expressed in TML voltage command units</td>
</tr>
<tr>
<td>IncrVoltage</td>
<td>Voltage increment expressed in TML internal units</td>
</tr>
<tr>
<td>Theta0</td>
<td>Initial value of electrical angle expressed in TML electrical angle units</td>
</tr>
<tr>
<td>Dtheta</td>
<td>Electric angle increment expressed in TML electrical angle increment units</td>
</tr>
<tr>
<td>MoveMoment</td>
<td>Defines the moment when the motion is started</td>
</tr>
</tbody>
</table>

**Description:** The function allows you to set the drives/motors in voltage test mode. In the test mode a saturated ramp voltage is applied to the motor, i.e. the voltage will increase with the `Incr Voltage` increment at each slow sampling period up to the `Max Voltage` value.

**Remark:** This is a test mode to be used only in some special cases for drives setup. The test mode is not supposed to be used during normal operation.

For AC motors (like for example the brushless motors), you have the possibility to rotate a voltage reference vector with a programmable speed. As a result, these motors can be moved in an "open-loop" mode without using the position sensor. The main advantage of this test mode is the possibility to conduct in a safe way a series of tests, which can offer important information about the motor parameters, drive status and the integrity of the its connections.

The voltage reference vector initial position is set through parameter `Theta0` and its speed through `Dtheta`. For DC motors set these parameters to zero.

The motion is executed:

- Immediately when `MoveMoment = UPDATE_IMMEDIATE`
- When a programmed event occurs if `MoveMoment = UPDATE_ON_EVENT`
- If you select `MoveMoment = UPDATE_NONE`, the movement is parameterized, but does not execute. You'll need to issue an update command to determine the execution of the movement. Use the `TS_UpdateImmediate` or the `TS_UpdateOnEvent` functions in order to activate the movement.

<td>Defines the moment when the motion is started</td>
</tr>
</tbody>
</table>

Description: The function allows you to set the drives/motors in torque test mode. In the test mode a saturated ramp current is applied to the motor, i.e. the current will increase with the IncrTorque increment at each slow sampling period up to the MaxTorque value.

Remark: This is a test mode to be used only in some special cases for drives setup. The test mode is not supposed to be used during normal operation.

For AC motors (like for example the brushless motors), you have the possibility to rotate a current reference vector with a programmable speed. As a result, these motors can be moved in an “open-loop” mode without using the position sensor. The main advantage of this test mode is the possibility to conduct in a safe way a series of tests, which can offer important information about the motor parameters, drive status and the integrity of its connections.

The current reference vector initial position is set through parameter Theta0 and its speed through Dtheta. For DC motors set these parameters to zero.

The motion is executed:

- Immediately when MoveMoment = UPDATE_IMMEDIATE
- When a programmed event occurs if MoveMoment = UPDATE_ON_EVENT
- If you select MoveMoment = UPDATE_NONE, the movement is parameterized, but does not execute. You’ll need to issue an update command to determine the execution of the movement. Use the TS_UpdateImmediate or the TS_UpdateOnEvent functions in order to activate the movement.

</table>

Output

return | TRUE if no error, FALSE if error |

Description: The function programs a drive/motor to work in PVT motion mode. In PVT motion mode the drive/motor performs a positioning path described through a series of points. Each point specifies the desired Position, Velocity and Time, i.e. contains a PVT data. Between the points the built-in reference generator performs a 3rd order interpolation.

Remark: The function block just programs the drive/motor for PVT mode. The motion mode is activated with function TS_SendPVTFirstPoint and the PVT points are sent to the drive with function TS_SendPVTPoint.

A key factor for getting a correct positioning path in PVT mode is to set correctly the distance in time between the points. Typically this is 10-20ms, the shorter the better. If the distance in time between the PVT points is too big, the 3rd order interpolation may lead to important variations compared with the desired path.

The PVT motion mode can be started only when the previous motion is complete. However, you can switch at any moment to another motion mode.

The PVT mode can be relative or absolute. In the absolute mode, each PVT point specifies the position to reach. The initial position may be either the current position reference TML variable TPOS (AbsolutePositionSource = TRUE) or a preset value read from the TML parameter PVTPOS0 (AbsolutePositionSource = FALSE). In the relative mode, each PVT point specifies the position increment relative to the previous point. In both cases, the time is relative to the previous point i.e. represents the duration of a PVT segment. For the first PVT point, the time is measured from the starting of the PVT mode.

Remark: The PVT mode, absolute or relative, is set with function TS_SendPVTFirstPoint.

Each time when the drive receives a new PVT point, it is saved into the PVT buffer. The reference generator empties the buffer as the PVT points are executed. The PVT buffer is of type FIFO (first in, first out). The default length of the PVT buffer is 7 PVT points. Each entry in the buffer is made up of 9 words, so the default length of the PVT buffer in terms of how much memory space is...
reserved is 63 (3Fh) words. The drive/motor automatically sends messages to the host when the buffer is full, low or empty. The messages contain the PVT status (TML variable PVTSTS). The buffer full condition occurs when the number of PVT points in the buffer is equal with the buffer size. The buffer low condition occurs when the number of PVT points in the buffer is less or equal with a programmable value. The level for BufferLow signaling is updated when ChangeLowLevel = TRUE with the value of parameter LowLevelValue. The buffer empty condition occurs when the buffer is empty and the execution of the last PVT point is over.

When the PVT buffer becomes empty the drive/motor:

- Remains in PVT mode if the velocity of last PVT point executed is zero and waits for new points to receive
- Enters in quick stop mode if the velocity of last PVT point executed is not zero

Therefore, a correct PVT sequence must always end with a last PVT point having velocity zero.

**Remarks:**

1. *The PVT and PT modes share the same buffer. Therefore the TML parameters and variables associated with the buffer management are the same.*

2. *Both the PVT buffer size and its start address are programmable via TML parameters PVTBUFBEGIN(int@0x0864) and PVTBUFLEN (int@0x0865). Therefore if needed, the PVT buffer size can be substantially increased. Use TS_SetIntegerVariable to change the PVT buffer parameters.*

Each PVT point also includes a 7-bit integrity counter. The integrity counter value must be incremented by the host by one, each time a new PVT point is sent to the drive/motor. If the integrity counter error checking is activated (IntegrityChecking = TRUE), the drive compares its integrity counter value with the one sent with the PVT point. This comparison is done every time a PVT point is received. If the values of the two integrity counters do not match, the integrity check error is triggered, the drive/motor sends messages with PVTSTS to the host and the received PVT point is discarded. Each time a PVT point is accepted (the integrity counters match or the integrity counter error checking is disabled), the drive automatically increments its internal integrity counter.

The default value of the internal integrity counter after power up is 0. Set ChangePVTCounter = TRUE to change its value with PVTCounterValue parameter. The integrity counter checking is disabled when parameter IntegrityChecking = FALSE.

<td>The new value for the level of the BufferLow signal</td>
</tr>
</tbody>
</table>

Description: The function programs a drive/motor to work in PT motion mode. In PT motion mode the drive/motor performs a positioning path described through a series of points. Each point specifies the desired Position and Time, i.e. contains a PT data. Between the points the built-in reference generator performs a linear interpolation.

Remark: The function block just programs the drive/motor for PT mode. The motion mode is activated with function TS_SendPTFirstPoint and the PT points are sent to the drive with function TS_SendPTPoint.

The PT motion mode can be started only when the previous motion is complete. However, you can switch at any moment to another motion mode.

The PT mode can be relative or absolute. In the absolute mode, each PT point specifies the position to reach. The initial position may be either the current position reference TML variable TPOS (AbsolutePositionSource = TRUE) or a preset value read from the TML parameter PVTPOS0 (AbsolutePositionSource = FALSE). In the relative mode, each PT point specifies the position increment relative to the previous point. In both cases, the time is relative to the previous point i.e. represents the duration of a PT segment. For the first PT point, the time is measured from the starting of the PT mode.

Remark: The PT mode, absolute or relative, is set with function TS_SendPTFirstPoint.

Each time when the drive receives a new PT point, it is saved into the PT buffer. The reference generator empties the buffer as the PT points are executed. The PT buffer is of type FIFO (first in, first out). The default length of the PT buffer is 7 PT points. The drive/motor automatically sends messages to the host when the buffer is full, low or empty. The messages contain the PT status (TML variable PVTSTS). The buffer full condition occurs when the number of PT points in the buffer is equal with the buffer size. The buffer low condition occurs when the number of PT points in the buffer is less or equal with a programmable value. Set ChangeLowLevel = TRUE to change the level for BufferLow signaling with the value of parameter LowLevelValue.
empty condition occurs when the buffer is empty and the execution of the last PT point is over. When the PT buffer becomes empty the drive/motor keeps the position reference unchanged.

Remarks:

3. The PT and PVT modes share the same buffer. Therefore the TML parameters and variables associated with the buffer management are the same.

4. Both the PT buffer size and its start address are programmable via TML parameters PVTBUFBEGIN (int@0x0864) and PVTBUFLLEN (int@0x0865). Therefore if needed, the PT buffer size can be substantially increased. Use TS_SetIntegerVarabler to change the PT buffer parameters.

Each PT point also includes a 7-bit integrity counter. The integrity counter value must be incremented by the host by one, each time a new PT point is sent to the drive/motor. If the integrity counter error checking is activated (IntegrityChecking = FALSE), the drive compares its integrity counter value with the one sent with the PT point. This comparison is done every time a PT point is received. If the values of the two integrity counters do not match, the integrity check error is triggered, the drive/motor sends messages with PVTSTS to the host and the received PT point is discarded. Each time a PT point is accepted (the integrity counters match or the integrity counter error checking is disabled), the drive automatically increments its internal integrity counter.

The default value of the internal integrity counter after power up is 0. Set ChangePTCounter = TRUE to change the value of integrity counter with PTCounterValue parameter. The integrity counter checking is disabled when parameter IntegrityChecking = TRUE.

</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function programs the active axis as master in electronic gearing. Once at each slow loop sampling time interval, the master sends either its load position APOS (ReferenceBase = FROM_MEASURE) or its position reference TPOS (ReferenceBase = FROM_REFERENCE) to the axis or the group of axes specified in the parameter SlaveID.

Remark: The ReferenceBase = FROM_MEASURE option is not valid if the master operates in open loop. It is meaningless if the master drive has no position sensor.

The SlaveID is interpreted either as the Axis ID of one slave (Group = FALSE) or the value of a Group ID i.e. the group of slaves to which the master should send its data (Group = TRUE).

The master operation is enabled with Enable = TRUE and is disabled when Enable = FALSE. In both cases, these operations have no effect on the motion executed by the master.

If the master activation is done AFTER the slaves are set in electronic gearing mode, set SetSlavePos = TRUE to determine the master to send an initialization message to the slaves.

The commands are executed:

- Immediately when MoveMoment = UPDATE_IMMEDIATE
- When a programmed event occurs if MoveMoment = UPDATE_ON_EVENT
- If you select MoveMoment = UPDATE_NONE, the movement is parameterized, but does not execute. You'll need to issue an update command to determine the execution of the movement. Use the TS_UpdateImmediate or the TS_UpdateOnEvent functions in order to activate the movement.

</tr>
</tbody>
</table>

Return: TRUE if no error, FALSE if error

Description: The function programs the active axis to operate as slave in electronic gearing. In electronic gearing slave mode the drive/motor performs a position control. At each slow loop sampling period, the slave computes the master’s position increment and multiplies it with its programmed gear ratio. The result is the slave’s position reference increment, which added to the previous slave position reference gives the new slave position reference.

The gear ratio is the result of the division Numerator / Denominator. Numerator is a signed integer, while the Denominator is unsigned integer. The Numerator sign indicates the direction of movement: positive – same as the master, negative – reversed to the master. Numerator and Denominator are used by an automatic compensation procedure that eliminates the round off errors, which occur when the gear ratio is an irrational number like: 1/3 (Slave = 1, Master = 3).

The slave can get the master position in two ways:

1. Via a communication channel (EnableSlave = SLAVE_COMMUNICATION_CHANNEL), from a drive/motor set as master with function block TS_SetGearingMaster
2. Via an external digital reference of type pulse & direction or quadrature encoder (EnableSlave = SLAVE_2ND_ENCODER)

Remark: Set EnableSlave = SLAVE_NONE if you want to program the motion mode parameters without enabling it.

When master position is provided via the external digital interface, the slave computes the master position by counting the pulse & direction or quadrature encoder signals. The initial value of the master position is set by default to 0. Use function TS_SetLongVariable to change its value by writing the desired value in the TML variable APOS2.

You can smooth the slave coupling with the master, by limiting the maximum acceleration on the slave. This is particularly useful when the slave must couple with a master running at high speed. This feature is activated when the parameter LimitVariation has a positive value and disabled when its value is zero.
Set ReferenceBase = FROM_REFERENCE if you want the reference generator to compute the slave position starting from the actual values of the position and speed reference. Set ReferenceBase = FROM_MEASURE if you want the reference generator to compute the slave position starting from the actual values of the load/motor position and speed. When this option is used, at the beginning of each new motion profile, the position and speed reference are updated with the actual values of the load/motor position and speed.

**Remarks:**

1. The function requires drive/motor position loop to be closed. During the drive/motor setup select Position at Control Mode and perform the position controller tuning.
2. Use function block **TS_SetGearingMaster** to program a drive/motor as master in electronic gearing.
3. When the reference is read from second encoder or pulse & direction inputs you don't need to program a drive/motor as master in electronic gearing.

<tr>
<td>MultInputFactor</td>
<td>CAM table input scaling factor</td>
</tr>
<tr>
<td>MultOutputFactor</td>
<td>CAM table output scaling factor</td>
</tr>
</tbody>
</table>

Output: return TRUE if no error, FALSE if error

Description: The function block programs the active axis to operate as slave in electronic camming relative mode. The slave drive/motor executes a cam profile function of the master drive/motor position. The cam profile is defined by a cam table – a set of (X, Y) points, where X is cam table input i.e. the master position and Y is the cam table output i.e. the corresponding slave position. Between the points the drive/motor performs a linear interpolation. In electronic camming relative mode the output of the cam table is added to the slave actual position.

The cam tables are previously stored in drive/motor non-volatile memory with function TS_CamDownload. After download, previously starting the camming slave, you have to initialize the cam table, i.e. to copy it from non-volatile memory to RAM memory. Use function TS_CamInitialization to initialize a cam table. The active cam table is selected through parameter RunAddress. The RunAddress must contain the drive/motor RAM address where the cam table was copied.

The slave can get the master position in two ways:

1. Via a communication channel (EnableSlave = SLAVE_COMMUNICATION_CHANNEL), from a drive/motor set as master with function block TS_SetGearingMaster
2. Via an external digital reference of type pulse & direction or quadrature encoder (EnableSlave = SLAVE_2ND_ENCODER)

Remark:

1. Set EnableSlave = SLAVE_NONE if you want to program the motion mode parameters without enabling it.
2. Use function block TS_SetCammingMaster to program a drive/motor as master in electronic camming. When the reference is read from second encoder or pulse & direction inputs you don’t need to program a drive/motor as master in electronic camming
When master position is provided via the external digital interface, the slave computes the master position by counting the pulse & direction or quadrature encoder signals. The initial value of the master position is set by default to 0. Use function block TS_SetLongVariable to change its value by writing the desired value in the TML variable APOS2.

With parameter **OffsetFromMaster** you can shift the cam profile versus the master position, by setting an offset for the slave. The cam table input is computed as the master position minus the cam offset. For example, if a cam table is defined between angles 100 to 250 degrees, a cam offset of 50 degrees will make the cam table to execute between master angles 150 and 300 degrees.

You can compress/extend the cam table input. Set the parameter **MultInputFactor** with the correction factor by which the cam table input is multiplied. For example, an input correction factor of 2, combined with a cam offset of 180 degrees, will make possible to execute a cam table defined for 360 degrees of the master in the last 180 degrees.

You can also compress/extend the cam table output. Specify through input **MultOutputFactor** the correction factor by which the cam table output is multiplied. This feature addresses the applications where the slaves must execute different position commands at each master cycle, all having the same profile defined through a cam table. In this case, the drive/motor is programmed with a unique normalized cam profile and the cam table output is multiplied with the relative position command updated at each master cycle.

**Remark:** If the OffsetFromMaster, MultInputFactor and/or MultOutputFactor are set to zero the drive/motor will use the value previously set for the parameter or the default value. With this option the TML code generated by this function is reduced.

</tbody>
</table>

Description: The function block programs the active axis to operate as slave in electronic camming absolute mode. The slave drive/motor executes a cam profile function of the master drive/motor position. The cam profile is defined by a cam table – a set of (X, Y) points, where X is cam table input i.e. the master position and Y is the cam table output i.e. the corresponding slave position. Between the points the drive/motor performs a linear interpolation. In electronic camming absolute mode the output of the cam table represents the position to reach.

The electronic camming absolute mode may generate abrupt variations on the slave position reference, mainly at entry in the camming mode. Set parameter LimitVariation to limit the speed of the slave during travel towards the position to reach. The limitation is disabled if the LimitVariation is set to zero.

The cam tables are previously stored in drive/motor non-volatile memory with function TS_CamDownload. After download, previously starting the camming slave, you have to initialize the cam table, i.e. to copy it from non-volatile memory to RAM memory. Use function TS_CamInitialization to initialize a cam table. The active cam table is selected through parameter RunAddress. The RunAddress must contain the drive/motor RAM address where the cam table was copied.

The slave can get the master position in two ways:

1. Via a communication channel (EnableSlave = SLAVE_COMMUNICATION_CHANNEL), from a drive/motor set as master with function block TS_SetGearingMaster
2. Via an external digital reference of type pulse & direction or quadrature encoder (EnableSlave = SLAVE_2ND_ENCODER)

Remark:
1. Set `EnableSlave = SLAVE_NONE` if you want to program the motion mode parameters without enabling it.

2. Use function block `TS_SetCammingMaster` to program a drive/motor as master in electronic camming. When the reference is read from second encoder or pulse & direction inputs you don’t need to program a drive/motor as master in electronic camming.

When master position is provided via the external digital interface, the slave computes the master position by counting the pulse & direction or quadrature encoder signals. The initial value of the master position is set by default to 0. Use function block `TS_SetLongVariable` to change its value by writing the desired value in the TML variable APOS2.

Set the parameter `OffsetFromMaster` to shift the cam profile versus the master position, by setting an offset for the slave. The cam table input is computed as the master position minus the cam offset. For example, if a cam table is defined between angles 100 to 250 degrees, a cam offset of 50 degrees will make the cam table to execute between master angles 150 and 300 degrees.

You can compress/extend the cam table input. Set the parameter `MultInputFactor` with the correction factor by which the cam table input is multiplied. For example, an input correction factor of 2, combined with a cam offset of 180 degrees, will make possible to execute a cam table defined for 360 degrees of the master in the last 180 degrees.

You can also compress/extend the cam table output. Specify through input `MultOutputFactor` the correction factor by which the cam table output is multiplied. This feature addresses the applications where the slaves must execute different position commands at each master cycle, all having the same profile defined through a cam table. In this case, the drive/motor is programmed with a unique normalized cam profile and the cam table output is multiplied with the relative position command updated at each master cycle.

**Remark:** If the `OffsetFromMaster`, `MultInputFactor` and/or `MultOutputFactor` are set to zero the drive/motor will use the value previously set for the parameter or the default value. With this option the TML code generated by this function is reduced.

**Associated examples:** –
3.3.6.22 TS_CamDownload

Prototype:

BOOL TML_EXPORT TS_CamDownload(LPCSTR pszCamFile, WORD LoadAddress, WORD RunAddress, WORD& wNextLoadAddr, WORD& wNexLoadAddr);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pszCamFile</td>
<td>The name of the file containing the cam table description</td>
</tr>
<tr>
<td>LoadAddress</td>
<td>The non-volatile memory (EEPROM) address where the cam table is downloaded</td>
</tr>
<tr>
<td>RunAddress</td>
<td>The RAM address where the cam table is copied at initialization</td>
</tr>
<tr>
<td>wNextLoadAddr</td>
<td>Next available EEPROM address from where a cam table can be downloaded</td>
</tr>
<tr>
<td>wNextRunAddr</td>
<td>Next available RAM address where a cam table can be copied</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function downloads a cam table in the drive/motor non-volatile memory (EEPROM) starting with address LoadAddress. The RunAddress parameter is required to compute the wNextRunAddr. The function returns the next valid memory addresses for cam tables through output parameters wNextLoadAddr respectively wNextRunAddr. If the values returned by the function are 0 then there is no memory available.

The LoadAddress and RunAddress for the first cam table downloaded are computed by EasyMotion Studio and displayed in the dialogue Memory Settings. To open the dialogue Memory Settings select the appropriate TML application and in Application General Information press the button Memory Settings. For the next cam tables, if available, the LoadAddress and RunAddress are the values returned by the previous call of function TS_CamDownload (parameters wNextLoadAddr and wNextRunAddr).

The cam table description is read from the file pszCamFile. The file is generated from EasyMotion Studio and has the extension *.cam.

Steps to follow when using cam tables:

1. Create or import a cam table in EasyMotion Studio. The cam table is saved by EasyMotion Studio as a *.cam file in the application directory.
2. Download the cam table in the drive/motor non-volatile memory with TS_CamDownload
3. Initialize the cam table with TS_CamInitialization function
4. Program the drive/motor to operate as slave in electronic camming mode with TS_SetCammingSlaveAbsolute or TS_SetCammingSlaveRelative. Select the cam table used with the parameter RunAddress.

Related functions: TS_SetCammingSlaveRelative, TS_SetCammingSlaveAbsolute, TS_CamInitialization

Associated examples: Ex07_Multiaxes
3.3.6.23 TS_CamInitialization

Prototype:

BOOL TML_EXPORT TS_CamInitialization(WORD LoadAddress, WORD RunAddress);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LoadAddress</td>
<td>Non-volatile memory (EEPROM) address where the cam table is downloaded</td>
</tr>
<tr>
<td>RunAddress</td>
<td>RAM address where the cam table is copied at run time</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function copies a cam table from drive/motor non-volatile memory in the RAM memory at address RunAddress. The cam table was previously downloaded with function TS_CamDownload at non-volatile memory address LoadAddress. The function must be called for each cam table used by the application.

Related functions: TS_SetCammingSlaveRelative, TS_SetCammingSlaveAbsolute, TS_CamDownload

Associated examples: Ex07_MultiAxes
3.3.6.24 TS_SetMasterResolution

Prototype:

BOOL TML_EXPORT TS_SetMasterResolution(LONG MasterResolution);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>MasterResolution Number of encoder counts per one revolution of the master position sensor.</td>
</tr>
<tr>
<td>Output</td>
<td>return TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function sets the TML parameter MASTERRES with the value MasterResolution.

The master resolution is needed by the electronic gearing or camming slaves to compute correctly the master position and speed (i.e. the position increment). If master position is not cyclic (i.e. the resolution is equal with the whole 32-bit range of position), set master resolution to 0x80000001.

Remark: Call function TS_SetMasterResolution before activating the electronic gearing or camming slave mode with function TS_SetGearingSlave respectively TS_SetCammingSlaveAbsolute/Relative.

Related functions: TS_SetGearingSlave, TS_SetCammingSlaveAbsolute, TS_SetCammingSlaveRelative

Associated examples: Ex07_MultiAxes
3.3.6.25  TS_SendSynchronization

Prototype:

BOOL TML_EXPORT TS_SendSynchronization(LONG Period);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Period: Time period between two synchronization messages. It is expressed in TML time units</td>
</tr>
<tr>
<td>Output</td>
<td>return: TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function enables/disables the synchronization procedure between axes. The synchronization process is activated when the parameter Period has a non-zero value. The active axis is set as the synchronization master and the other axes become synchronization slaves. To disable the synchronization procedure set the Period to zero.

The synchronization process is performed in two steps. First, the master sends a synchronization message to all axes, including to itself. When this message is received, all the axes read their own internal time. Next, the master sends its internal time to all the slaves, which compare it with their own internal time. If there are differences, the slaves correct slightly their sampling periods in order to keep them synchronized with those of the master. As effect, when synchronization procedure is active, the execution of the control loops on the slaves is synchronized with those of the master within a 10µs time interval. Due to this powerful feature, drifts between master and slave axes are eliminated. The Period represents the time interval in internal units between the synchronization messages sent by the master. Recommended value is 20ms.

3.3.7 Motor commands

3.3.7.1 TS_Power

Prototype:

BOOL TML_EXPORT TS_Power(BOOL Enable);

Arguments:

<table>
<thead>
<tr>
<th>Input/Output</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Enable</td>
<td>Enables/disables the power stage of the active axis</td>
</tr>
<tr>
<td>Output</td>
<td>return</td>
<td>TRUE if no error; FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function enables/disables the power stage of the active axis. If Enable = TRUE the power stage is enabled (executes the TML command AxisON). The power stage is disabled (executes the TML command AxisOFF) when Enable = FALSE.

Related functions: TS_ResetFault, TS_Reset

Associated examples: All
3.3.7.2 TS_UpdateImmediate

Prototype:

BOOL TML_EXPORT TS_UpdateImmediate(void);

Arguments:

<table>
<thead>
<tr>
<th>Input/Output</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Output</td>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function updates the motion mode immediately. It allows you to start a motion previously programmed. This can be useful for example if you already defined a motion and you want to start it in a specific context (after testing a condition, event, input port, etc.). The command can also be useful to repeat the last motion that was already defined and eventually executed (as for example a relative move).

Related functions: TS_UpdateOnEvent

Associated examples: Ex08_PVT
3.3.7.3 TS_UpdateOnEvent

Prototype:

BOOL TML_EXPORT TS_UpdateOnEvent(void);

Arguments:

<table>
<thead>
<tr>
<th>Input/Output</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>–</td>
<td>–</td>
</tr>
<tr>
<td>Output</td>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function updates the motion mode on next event occurrence. It allows you to start a motion that was previously programmed at the occurrence of the active event. This can be useful for example if you already defined a motion and you want to start it when an event occurs. The command can also be used to repeat the last motion that was already defined and eventually executed (as for example a relative move), when the event will occur.

Related functions: TS_UpdateImmediate

3.3.7.4 TS_Stop

Prototype:

BOOL TML_EXPORT TS_Stop(void);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>–</td>
</tr>
<tr>
<td>Output</td>
<td>return</td>
</tr>
<tr>
<td></td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function stops the motor with the deceleration rate set in TML parameter CACC. The drive/motor decelerates following a trapezoidal speed profile. If the function is called during the execution of an S-curve profile, the deceleration profile may be chosen between a trapezoidal or an S-curve profile. You can detect when the motor has stopped by setting a motion complete event with function TS_SetEventOnMotionComplete and waiting until the event occurs (WaitEvent = TRUE). When the drive performs torque control the drive is set in torque external mode with current reference = 0.

Remarks:

- In order to restart after a TS_Stop call you need to set again the motion mode. This operation disables the stop mode and allows the motor to move.
- When TS_Stop is executed it will automatically stop any TML program execution, to avoid overwriting the command from the TML program.
- During abrupt stops an important energy may be generated. If the power supply can’t absorb the energy generated by the motor, it is necessary to foresee an adequate surge capacitor in parallel with the drive supply to limit the over voltage.

Related functions: TS_QuickStopDecelerationRate

Associated examples: Ex02_DriveStatus, Ex04_BasicMove, Ex05_Homing, Ex06谢ExternalReference
3.3.7.5  TS_SetPosition

Prototype:

BOOL TML_EXPORT TS_SetPosition(long PosValue);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PosValue</td>
<td>The value used to set the position, expressed in TML position units</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function sets/changes the referential for position measurement by changing simultaneously the load position (TML variable APOS) and the target position values (TML variable APOS), while keeping the same position error. Future motion commands will then be related to the absolute value, as updated at this point to PosValue.

Related functions:

Associated examples: Ex04_BasicMove, Ex05_Homing, Ex07_MultiAxes, Ex09_Logger, Ex11_IOHandling
3.3.7.6 TS_SetTargetPositionToActual

Prototype:

BOOL TML_EXPORT TS_SetTargetPositionToActual(void);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>–</td>
</tr>
<tr>
<td>Output</td>
<td>return</td>
</tr>
</tbody>
</table>

Description: The function sets the value of the target position (the position reference) to the value of the actual load position i.e. TPOS = APOS_LD. The command may be used in closed loop systems when the load/motor is still following a hard stop, to reposition the target position to the actual load position.

Remark: The command is automatically done if the next motion mode is set with ReferenceBase = FROM_MEASURE. In this case the target position and speed are both updated with the actual values of the load position and respectively load speed: TPOS = APOS_LD and TSPD = ASPD_LD.

Associated examples: –
3.3.7.7 TS_SetCurrent

Prototype:

BOOL TML_EXPORT TS_SetCurrent(short CrtValue);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>CrtValue Value at which the motor current reference is set expressed in TML current units</td>
</tr>
<tr>
<td>Output</td>
<td>Return TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function sets the motor run current with CrtValue. The run current is used by the drive to control the step motor in open loop.

Remark: The command is valid only for configurations with step motor operating in open loop.

Related functions: –

Associated examples: –
3.3.7.8 TS_QuickStopDecelerationRate

Prototype:

BOOL TML_EXPORT TS_QuickStopDecelerationRate(DOUBLE Deceleration);

Arguments:

<table>
<thead>
<tr>
<th>Input/Output</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Deceleration</td>
<td>The value written in TML parameter CDEC</td>
</tr>
<tr>
<td>Output</td>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function sets on the active axis the TML parameter CDEC with the value Deceleration. The drive/motor uses the deceleration rate when:

- The function TS_Stop is executed during a positioning set with TS_MoveSCurveRelative/Absolute and option `DecelerationType = TRAPEZOIDAL_SPEED_PROFILE`
- Enters in quick stop mode. The drive enters in quick stop mode if an error requiring the immediate stop of the motion occurs (like triggering a limit switch or following a command error), the drive/motor enters automatically

Related functions: TS_Stop, TS_MoveSCurveRelative, TS_MoveSCurveAbsolute

3.3.8 Events

3.3.8.1 TS_CheckEvent

Prototype:

BOOL TML_EXPORT TS_CheckEvent(BOOL &event);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td></td>
</tr>
<tr>
<td>Output</td>
<td>Event</td>
</tr>
<tr>
<td></td>
<td>Signal if event occurred</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function checks if the actually active event occurred. If an event was defined using one of the SetEvent... functions with \texttt{WaitEvent = FALSE} then you can check if the event occurred using the \texttt{TS_CheckEvent} function.

This is an interesting alternative to the case when \texttt{WaitEvent} parameter was set to \texttt{TRUE} in one of the SetEvent... functions. In that case, if the event will not occur, due to some unexpected problems, the program will hang-up in an internal loop of the SetEvent... function, waiting for the event to occur.

Thus, in order to avoid such a problem, set the \texttt{WaitEvent} parameter to \texttt{FALSE}, in the SetEvent... function, and then call the \texttt{TS_CheckEvent} function from your application. In this way, you can detect if the event does not occur and eventually exit from the test loop after a given time period.

Related functions: all SetEvent... functions

Associated examples: Ex10_EventHandling
3.3.8.2 TS_SetEventOnMotionComplete

Prototype:

```c
BOOL TML_EXPORT TS_SetEventOnMotionComplete(BOOL WaitEvent, BOOL EnableStop);
```

Arguments:

<table>
<thead>
<tr>
<th>Input</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>WaitEvent</td>
<td>–</td>
</tr>
<tr>
<td></td>
<td>EnableStop</td>
<td>On motion complete stop the motion</td>
</tr>
</tbody>
</table>

| Output     | return    | TRUE if no error, FALSE if error                     |

Description: The function sets an event when the motion is completed. You can use, for example, this event to start your next move only after the actual move is finalized.

The motion complete condition is set in the following conditions:

- During position control:
  - If UPGRADE.11=1, when the position reference arrives at the position to reach (commanded position) and the position error remains inside a settle band for a preset stabilize time interval. The settle band is set with TML parameter POSOKLIM and the stabilize time with TML parameter TONPOSOK. This is the default condition.
  - If UPGRADE.11=0, when the position reference arrives at the position to reach (commanded position)

- During speed control, when the speed reference arrives at the commanded speed

The motion complete condition is reset when a new motion is started i.e. when the update command – UPD is executed.

Remark:

1. Use function TS_SetIntVariable to change the settle band and/or the stabilize time.
2. In case of steppers controlled open-loop, the motion complete condition for positioning is always set when the position reference arrives at the position to reach independently of the UPGRADE.11 status.

If the `WaitEvent = TRUE`, the function will continuously test the status of the drive event, and will wait until the event occurs. There is a drawback of this situation, if the event will not occur, due to some unexpected problems. In such a case, the program hangs-up in an internal loop of the `TS_SetEventOnMotionComplete` waiting for the event to occur.

If the parameter `WaitEvent = FALSE` you can check if the event occurred using the `TS_CheckEvent` function. In this way, you can detect if the event does not occur and eventually exit from the test loop after a given time period.

At event occurrence the motion is stopped if the parameter `EnableStop = TRUE`. Set `EnableStop = FALSE` if you do not want to stop the motion at event occurrence.

Related functions: TS_CheckEvent, and all other SetEvent… functions
Associated examples: Ex04_BasicMove, Ex05_Homing, Ex07_MultiAxes, Ex09_Logger, Ex11_IOHandling
3.3.8.3  TS_SetEventOnMotorPosition

Prototype:

BOOL TML_EXPORT TS_SetEventOnMotorPosition(SHORT PositionType, LONG Position, BOOL Over, BOOL WaitEvent, BOOL EnableStop);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PositionType</td>
<td>Specifies the motor position type: absolute or relative</td>
</tr>
<tr>
<td>Position</td>
<td>The position value that triggers the event expressed in TML position units.</td>
</tr>
<tr>
<td>Over</td>
<td>Specifies the condition tested</td>
</tr>
<tr>
<td>WaitEvent</td>
<td>Specifies if the function waits the event occurrence</td>
</tr>
<tr>
<td>EnableStop</td>
<td>Stop the motion when at event occurrence</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: It allows you to program an event function of motor position. The events can be: when the absolute (PositionType = ABSOLUTE_POSITION) or relative (PositionType = ABSOLUTE_RELATIVE) motor position is equal or over/under Position.

The absolute motor position is the measured position of the motor. The relative position is the load displacement from the beginning of the actual movement. For example if a position profile was started with the absolute load position 50 revolutions, when the absolute load position reaches 60 revolutions, the relative motor position is 10 revolutions.

The condition monitored for the event is set with parameter Over. For Over = TRUE the event is set when the motor position is equal or over the Position. When Over = FALSE the event is set if the motor position becomes equal or under Position.

If the WaitEvent = TRUE, the function tests continuously the event status, and waits until the event occurs. There is a drawback of this situation, if the event will not occur, due to some unexpected problems. In such a case, the program hangs-up in an internal loop of the TS_SetEventOnMotorPosition waiting for the event to occur.

If the parameter WaitEvent = FALSE you can check if the event occurred using the TS_CheckEvent function. In this way, you can detect if the event does not occur and eventually exit from the test loop after a given time period.

At event occurrence the motion is stopped if the parameter EnableStop = TRUE. Set EnableStop = FALSE if you do not want to stop the motion at event occurrence.

### 3.3.8.5 TS_SetEventOnMotorSpeed

**Prototype:**

```c
BOOL TML_EXPORT TS_SetEventOnMotorSpeed(DOUBLE Speed, BOOL Over, BOOL WaitEvent, BOOL EnableStop);
```

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Speed</td>
<td>The speed value that triggers the event expressed in TML speed units.</td>
</tr>
<tr>
<td>Over</td>
<td>Specifies the condition tested</td>
</tr>
<tr>
<td>WaitEvent</td>
<td>Specifies if the function waits the event occurrence</td>
</tr>
<tr>
<td>EnableStop</td>
<td>Stop the motion when at event occurrence</td>
</tr>
</tbody>
</table>

**Return**

TRUE if no error, FALSE if error

**Description:** It allows you to program an event function of motor speed. The events can be: when the motor speed is over (Over = TRUE) or under (Over = FALSE) the Speed parameter.

If the WaitEvent = TRUE, the function tests continuously the event status, and waits until the event occurs. There is a drawback of this situation, if the event will not occur, due to some unexpected problems. In such a case, the program hangs-up in an internal loop of the TS_SetEventOnMotionComplete waiting for the event to occur.

If the parameter WaitEvent = FALSE you can check if the event occurred using the TS_CheckEvent function. In this way, you can detect if the event does not occur and eventually exit from the test loop after a given time period.

At event occurrence the motion is stopped if the parameter EnableStop = TRUE. Set EnableStop = FALSE if you do not want to stop the motion at event occurrence.

**Related functions:** TS_CheckEvent, and all other SetEvent… functions

**Associated examples:** Ex04_BasicMove, Ex10_EventHandling
3.3.8.6 TS_SetEventOnLoadSpeed

Prototype:

BOOL TML_EXPORT TS_SetEventOnLoadSpeed(DOUBLE Speed, BOOL Over, BOOL WaitEvent, BOOL EnableStop);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Speed</td>
<td>The speed value that triggers the event expressed in TML speed units.</td>
</tr>
<tr>

</tbody>
</table>

Description: The function programs an event after a time period equal to the value of the Time parameter.

If the parameter WaitEvent = TRUE the function tests continuously the event status, and waits until the event occurs. There is a drawback of this situation, if the event will not occur, due to some unexpected problems. In such a case, the program hangs-up in an internal loop of the TS_SetEventOnTime function, waiting for the event to occur.

If the parameter WaitEvent = FALSE you can check if the event occurred using the TS_CheckEvent function. In this way, you can detect if the event does not occur and eventually exit from the test loop after a given time period.

At the event occurrence the motion is stopped if the parameter EnableStop = TRUE. Set EnableStop = FALSE if you do not want to stop the motion at event occurrence.

Remark: The timers start ONLY after the execution of the ENDINIT (end of initialization) command. Therefore you should not set wait events before calling the TS_DriveInitialization function.

Related functions: TS_CheckEvent, and all other SetEvent… functions

Associated examples: Ex04_BasicMove, Ex06_ExternalReference
3.3.8.8  TS_SetEventOnPositionRef

Prototype:

BOOL TML_EXPORT TS_SetEventOnPositionRef(LONG Position, BOOL Over, BOOL WaitEvent, BOOL EnableStop);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Position</td>
<td>The position reference value that triggers the event expressed in TML position units.</td>
</tr>
<tr>
<td>Over</td>
<td>Specifies the condition tested</td>
</tr>
<tr>
<td>WaitEvent</td>
<td>Specifies if the function waits the event occurrence</td>
</tr>
<tr>
<td>EnableStop</td>
<td>Stop the motion when at event occurrence</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: It allows you to program an event function of position reference. Setting this event you can detect when the position reference is over (Over = TRUE) or under (Over = FALSE) the value of parameter Position.

If the parameter WaitEvent = TRUE the function tests continuously the event status, and waits until the event occurs. There is a drawback of this situation, if the event will not occur, due to some unexpected problems. In such a case, the program hangs-up in an internal loop of the TS_SetEventOnPositionRef function, waiting for the event to occur.

If the parameter WaitEvent = FALSE you can check if the event occurred using the TS_CheckEvent function. In this way, you can detect if the event does not occur and eventually exit from the test loop after a given time period.

At the event occurrence the motion is stopped if the parameter EnableStop = TRUE. Set EnableStop = FALSE if you do not want to stop the motion at event occurrence.

Related functions: TS_CheckEvent, and all other SetEvent... functions

Associated examples: Ex07_MultiAxes
3.3.8.9 TS_SetEventOnSpeedRef

Prototype:

BOOL TML_EXPORT TS_SetEventOnSpeedRef(DOUBLE Speed, BOOL Over, BOOL WaitEvent, BOOL EnableStop);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Speed</td>
<td>The speed reference value that triggers the event expressed in TML speed units.</td>
</tr>
<tr>
<td>Over</td>
<td>Specifies the condition tested</td>
</tr>
<tr>
<td>WaitEvent</td>
<td>Specifies if the function waits the event occurrence</td>
</tr>
<tr>
<td>EnableStop</td>
<td>Stop the motion when at event occurrence</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: It allows you to program an event function of speed reference. Setting this event you can detect when the speed reference is over \((\text{Over} = \text{TRUE})\) or under \((\text{Over} = \text{FALSE})\) the value of parameter \textbf{Speed}.

If the parameter \textbf{WaitEvent} = \text{TRUE} the function tests continuously the event status, and waits until the event occurs. There is a drawback of this situation, if the event will not occur, due to some unexpected problems. In such a case, the program hangs-up in an internal loop of the \textbf{TS_SetEventOnSpeedRef} function, waiting for the event to occur.

If the parameter \textbf{WaitEvent} = \text{FALSE} you can check if the event occurred using the \textbf{TS_CheckEvent} function. In this way, you can detect if the event does not occur and eventually exit from the test loop after a given time period.

At the event occurrence the motion is stopped if the parameter \textbf{EnableStop} = \text{TRUE}. Set \textbf{EnableStop} = \text{FALSE} if you do not want to stop the motion at event occurrence.

Related functions: \textbf{TS_CheckEvent}, and all other \textbf{SetEvent…} functions

Associated examples: 

### 3.3.8.10 TS_SetEventOnTorqueRef

**Prototype:**

```c
BOOL TML_EXPORT TS_SetEventOnTorqueRef(DOUBLE Torque, BOOL Over, BOOL WaitEvent, BOOL EnableStop);
```

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Torque</td>
<td>The torque reference value that triggers the event expressed in TML current units.</td>
</tr>
<tr>
<td>Over</td>
<td>Specifies the condition tested</td>
</tr>
<tr>
<td>WaitEvent</td>
<td>Specifies if the function waits the event occurrence</td>
</tr>
<tr>
<td>EnableStop</td>
<td>Stop the motion when at event occurrence</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

**Description:** It allows you to program an event function of torque reference. Setting this event you can detect when the torque reference is over (`Over = TRUE`) or under (`Over = FALSE`) the value of parameter `Torque`.

If the parameter `WaitEvent = TRUE` the function tests continuously the event status, and waits until the event occurs. There is a drawback of this situation, if the event will not occur, due to some unexpected problems. In such a case, the program hangs-up in an internal loop of the `TS_SetEventOnTorqueRef` function, waiting for the event to occur.

If the parameter `WaitEvent = FALSE` you can check if the event occurred using the `TS_CheckEvent` function. In this way, you can detect if the event does not occur and eventually exit from the test loop after a given time period.

At the event occurrence the motion is stopped if the parameter `EnableStop = TRUE`. Set `EnableStop = FALSE` if you do not want to stop the motion at event occurrence.

**Related functions:** `TS_CheckEvent`, and all other `SetEvent...` functions

**Associated examples:**
3.3.8.11 TS_SetEventOnEncoderIndex

Prototype:

BOOL TML_EXPORT TS_SetEventOnEncoderIndex(SHORT IndexType, SHORT TransitionType, BOOL WaitEvent, BOOL EnableStop);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td></td>
</tr>
<tr>
<td>IndexType</td>
<td>Specifies the index monitored for transition</td>
</tr>
<tr>
<td>TransitionType</td>
<td>Specifies the input transition monitored</td>
</tr>
<tr>
<td>WaitEvent</td>
<td>Specifies if the function waits the event occurrence</td>
</tr>
<tr>
<td>EnableStop</td>
<td>Stop the motion when at event occurrence</td>
</tr>
<tr>
<td>Output</td>
<td>return TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: It allows you to program an event function of drive/motor encoder index inputs. You can monitor the first encoder index (IndexType = Index_1) or the second encoder index (IndexType = Index_2). The event is triggered by encoder index transition low to high when TransitionType = TRANSITION_LOW_TO_HIGH or by the transition high to low when TransitionType = TRANSITION_HIGH_TO_LOW.

If the parameter WaitEvent = TRUE the function tests continuously the event status, and waits until the event occurs. There is a drawback of this situation, if the event will not occur, due to some unexpected problems. In such a case, the program hangs-up in an internal loop of the TS_SetEventOnEncoderIndex function, waiting for the event to occur.

If the parameter WaitEvent = FALSE you can check if the event occurred using the TS_CheckEvent function. In this way, you can detect if the event does not occur and eventually exit from the test loop after a given time period.

At the event occurrence the motion is stopped if the parameter EnableStop = TRUE. Set EnableStop = FALSE if you do not want to stop the motion at event occurrence.

Related functions: TS_CheckEvent, and all other SetEvent… functions

Associated examples: []
3.3.8.12 TS_SetEventOnLimitSwitch

Prototype:

```c
BOOL TML_EXPORT TS_SetEventOnLimitSwitch(SHORT LSWType, SHORT TransitionType, BOOL WaitEvent, BOOL EnableStop);
```

Arguments:

<table>
<thead>
<tr>
<th>Input/Output</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>LSWType</td>
<td>Specifies the limit switch monitored for transition</td>
</tr>
<tr>
<td>Input</td>
<td>TransitionType</td>
<td>Specifies the input transition monitored</td>
</tr>
<tr>
<td>Input</td>
<td>WaitEvent</td>
<td>Specifies if the function waits the event occurrence</td>
</tr>
<tr>
<td>Input</td>
<td>EnableStop</td>
<td>Stop the motion when at event occurrence</td>
</tr>
<tr>
<td>Output</td>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

**Description:** It allows you to program an event function of drive/motor limit switch inputs. The event is set:

- when a transition occurs on limit switch negative if parameter `LSWType = LSW_NEGATIVE`
- when a transition occurs on limit switch negative if parameter `LSWType = LSW_POSITIVE`

You can monitor the limit switch transition low to high when `TransitionType = TRANSITION_LOW_TO_HIGH` or the transition high to low when `TransitionType = TRANSITION_HIGH_TO_LOW`.

If the parameter `WaitEvent = TRUE` the function tests continuously the event status, and waits until the event occurs. There is a drawback of this situation, if the event will not occur, due to some unexpected problems. In such a case, the program hangs-up in an internal loop of the `TS_SetEventOnLimitSwitch` function, waiting for the event to occur.

If the parameter `WaitEvent = FALSE` you can check if the event occurred using the `TS_CheckEvent` function. In this way, you can detect if the event does not occur and eventually exit from the test loop after a given time period.

At the event occurrence the motion is stopped if the parameter `EnableStop = TRUE`. Set `EnableStop = FALSE` if you do not want to stop the motion at event occurrence.

**Related functions:** TS_CheckEvent and all other SetEvent… functions

**Associated examples:** Ex05_Homing
3.3.8.13 TS_SetEventOnDigitalInput

Prototype:

BOOL TML_EXPORT TS_SetEventOnDigitalInput(BYTE InputPort, SHORT IOState BOOL WaitEvent, BOOL EnableStop);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InputPort</td>
<td>Specifies the digital input monitored</td>
</tr>
<tr>
<td>IOState</td>
<td>The input state that trigger the event</td>
</tr>
<tr>
<td>WaitEvent</td>
<td>Specifies if the function waits the event occurrence</td>
</tr>
<tr>
<td>EnableStop</td>
<td>Stop the motion when at event occurrence</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: It allows you to program an event function of drive/motor general purpose digital inputs. The event is set when a transition occurs on digital input InputPort.

You can monitor when the digital input goes high (IOState = IO_HIGH) or the digital input goes low (IOState = IO_LOW).

If the parameter WaitEvent = TRUE the function tests continuously the event status, and waits until the event occurs. There is a drawback of this situation, if the event will not occur, due to some unexpected problems. In such a case, the program hangs-up in an internal loop of the TS_SetEventOnDigitalInput function, waiting for the event to occur.

If the parameter WaitEvent = FALSE you can check if the event occurred using the TS_CheckEvent function. In this way, you can detect if the event does not occur and eventually exit from the test loop after a given time period.

At the event occurrence the motion is stopped if the parameter EnableStop = TRUE. Set EnableStop = FALSE if you do not want to stop the motion at event occurrence.

Related functions: TS_CheckEvent and all other SetEvent… functions

Associated examples: ❄️
### 3.3.8.14 TS_SetEventOnHomeInput

**Prototype:**

```c
BOOL TML_EXPORT TS_SetEventOnHomeInput(SHORT IOState, BOOL WaitEvent, BOOL EnableStop);
```

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOState</td>
<td>Input port state (High/low)</td>
</tr>
<tr>
<td>WaitEvent</td>
<td>Specifies if the function waits the event occurrence</td>
</tr>
<tr>
<td>EnableStop</td>
<td>Stop the motion when at event occurrence</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

**Description:** It allows you to program an event function of drive/motor general purpose digital input assigned as home input. The home input is specific for each product and based on the setup data. The event is set when a transition occurs on home input.

You can monitor when the home input goes high (IOState = IO_HIGH) or the home input goes low (IOState = IO_LOW).

If the parameter `WaitEvent = TRUE` the function tests continuously the event status, and waits until the event occurs. There is a drawback of this situation, if the event will not occur, due to some unexpected problems. In such a case, the program hangs-up in an internal loop of the `TS_SetEventOnHomeInput` function, waiting for the event to occur.

If the parameter `WaitEvent = FALSE` you can check if the event occurred using the `TS_CheckEvent` function. In this way, you can detect if the event does not occur and eventually exit from the test loop after a given time period.

At the event occurrence the motion is stopped if the parameter `EnableStop = TRUE`. Set `EnableStop = FALSE` if you do not want to stop the motion at event occurrence.

**Related functions:** TS_CheckEvent and all other SetEvent… functions

**Associated examples:**
3.3.9 TML jumps and function calls

3.3.9.1 TS_GOTO

Prototype:

BOOL TML_EXPORT TS_GOTO(WORD address);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address</td>
<td>The memory address where the jump is made</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function commands the active axis to execute the TML code beginning from the address until TML instruction END is encountered. The TML code can be stored in the drive/motor non-volatile memory (EEPROM) or in the TML program memory.

Prior calling the TS_GOTO function you have to:

- Create a TML sequence using EasyMotion Studio
- Create the executable file (*.out) with the menu command Application | Motion | Build
- Download the TML code in the drive/motor memory with EasyMotion Studio or function TS_DownloadProgram
- Make sure that a valid instruction is found at address. Otherwise, unpredictable effects can occur, which can affect to correct operation of the drive/motor.

Remark:

1. For more details about drive/motor memory structure see the “Memory Map” topic from EasyMotion Studio help.
2. During the execution of a local TML program on the drive, any TML command sent on-line from the PC is treated with higher priority, and will be executed before executing the local TML code.

Related functions: TS_DownloadProgram, TS_GOTO_Label, TS_CALL, TS_CALL_Label

Associated examples: Ex08_PVT, Ex12_DistributedTasks
3.3.9.2 TS_GOTO_Label

Prototype:

BOOL TML_EXPORT TS_GOTO_Label(LPCSTR pszLabel);

Arguments:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pszLabel</td>
<td>TML program label where the jump is made</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function commands the active axis to execute the TML code beginning from label `pszLabel` until TML instruction `END` is encountered. The TML code can be stored in the drive/motor non-volatile memory (EEPROM) or in the TML program memory.

The string `pszLabel` must be a valid TML label, defined in EasyMotion Studio prior generating the setup information.

Prior calling the `TS_GOTO_Label` function you have to:

- Create a TML motion sequence using EasyMotion Studio. The commands sequence must start with `pszLabel` declaration.
- Create the executable file (*.out) with the menu command Application | Motion | Build
- Download the TML code in the drive/motor memory with EasyMotion Studio or function TS_DownloadProgram
- Generate the setup data (*.t.zip) for TML_lib using the menu command Application | Export to TML_lib... to include the new `pszLabel`

Remark:

1. For more details about drive/motor memory structure see the “Memory Map” topic from EasyMotion Studio help.
2. During the execution of a local TML program on the drive, any TML command sent on-line from the PC is treated with higher priority, and will be executed before executing the local TML code.

Related functions: TS_DownloadProgram, TS_GOTO, TS_CALL, TS_CALL_Label, TS_CancelableCALL, TS_CancelableCALL_Label

Associated examples: None
3.3.9.3 TS_CALL

Prototype:

BOOL TML_EXPORT TS_CALL (WORD address);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address</td>
<td>The memory address where the jump is made</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function commands the active axis to execute the TML function stored at address. The TML functions can be stored in the drive/motor non-volatile memory or in the TML program memory. The function execution ends when the TML instruction RET is encountered.

Prior calling the TS_CALL function you have to:

- Create at least one TML function using EasyMotion Studio
- Select, in the Memory Setting dialogue, from where you want to run the TML program: TML program or non-volatile memory.
- Create the executable file (*.out) with the menu command Application | Motion | Build
- In the Command Interpreter type the command ?Function_name to retrieve the memory address where the Function_name is stored. Repeat the above procedure for all the functions defined in EasyMotion Studio
- Download the TML code in the drive/motor memory with EasyMotion Studio or function TS_DownloadProgram
- Make sure that a valid TML code subroutine begins at address. Otherwise, unpredictable effects can occur, which can affect to correct operation of the drive/motor.

Remark:

1. For more details about drive/motor memory structure see the “Memory Map” topic from EasyMotion Studio help.
2. During the execution of a local TML program on the drive, any TML command sent on-line from the PC is treated with higher priority, and will be executed before executing the local TML code.

Related functions: TS_DownloadProgram, TS_CALL_Label, TS_CancelableCALL, TS_CancelableCALL_Label, TS_GOTO, TS_GOTO_label

Associated examples: 

© Technosoft 2017 97 TML_LIB – User Manual
3.3.9.4 TS_CALL_Label

Prototype:

BOOL TML_EXPORT TS_CALL_Label (LPCSTR pszFunctionName);

Arguments:

<table>
<thead>
<tr>
<th>Input</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>pszFunctionName</td>
<td>Name of the TML function</td>
</tr>
<tr>
<td>Output</td>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function commands the active axis to execute the TML function pszFunctionName. The TML functions can be stored in the drive/motor non-volatile memory or in the TML program memory. The function execution ends when the TML instruction RET is encountered.

The string pszFunctionName must be a valid TML function name, defined in EasyMotion Studio prior generating the setup information.

Prior calling the TS_CALL_Label function you have to:

- Create a TML function having the name pszFunctionName using EasyMotion Studio
- Select, in the Memory Setting dialogue, from where you want to run the TML program: TML program or non-volatile memory (EEPROM).
- Create the executable file (*.out) with the menu command Application | Motion | Build
- Generate the setup data (*.t.zip) for TML_lib using the menu command Application | Export to TML_lib… to include the new pszFunctionName
- Download the TML code in the drive/motor memory with EasyMotion Studio or function TS_DownloadProgram

Remark:

1. For more details about drive/motor memory structure see the “Memory Map” topic from EasyMotion Studio help.
2. During the execution of a local TML program on the drive, any TML command sent on-line from the PC is treated with higher priority, and will be executed before executing the local TML code.

Related functions: TS_DownloadProgram, TS_CALL, TS_GOTO, TS_GOTO_Label, TS_CancelableCALL, TS_CancelableCALL_Label

Associated examples: ☐
### 3.3.9.5 TS_CancelableCALL

**Prototype:**

```c
BOOL TML_EXPORT TS_CancelableCALL(WORD address);
```

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address</td>
<td>The TML program memory address from where the TML function is stored</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

**Description:** The function commands the active axis to execute the TML function stored at `address`. Use this command if the exit from the called TML function depends on conditions that may not be reached. In this case, using function **TS_Abort** you can terminate the function execution and return to the next instruction after the call. The TML functions can be stored in the drive/motor non-volatile memory or in the TML program memory. The execution of a function called with **TS_CancelableCALL** is signaled with bit SRL.8, when the function execution ends the bit is reset.

Prior calling the **TS_CancelableCALL** function you have to:

- Create at least one TML function using **EasyMotion Studio**
- Select, in the **Memory Setting** dialogue, from where you want to run the TML program: TML program or non-volatile memory.
- Create the executable file (*.out) with the menu command **Application | Motion | Build**
- Download the TML code in the drive/motor memory with EasyMotion Studio or function **TS_DownloadProgram**
- In the **Command Interpreter** type the command `?Function_name` to retrieve the memory address where the `Function_name` is stored. Repeat the procedure above for all the functions defined in EasyMotion Studio.
- Make sure that a valid TML code subroutine begins at `address`. Otherwise, unpredictable effects can occur, which can affect to correct operation of the drive/motor.

**Remark:**

1. You can call only one function at a time using the **TS_CancelableCALL**. Any cancelable call issued during the execution of a function called with **TS_CancelableCALL** is ignored. This situation is signaled with bit SRL.7.
2. For more details about drive/motor memory structure see the “Memory Map” topic from **EasyMotion Studio help**.
3. During the execution of a local TML program on the drive, any TML command sent on-line from the PC is treated with higher priority, and will be executed before executing the local TML code.

**Related functions:** **TS_DownloadProgram**, **TS_CALL**, **TS_CALL_Label**, **TS_CancelableCALL_Label**

**Associated examples:** 

© Technosoft 2017
3.3.9.6  TS_CancelableCALL_Label

Prototype:

BOOL TML_EXPORT TS_CancelableCALL_Label (LPCSTR pszFunctionName);

Arguments:

<table>
<thead>
<tr>
<th>Input/Output</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>pszFunctionName</td>
<td>Name of the TML function</td>
</tr>
<tr>
<td>Output</td>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function commands the active axis to execute the TML function stored at pszFunctionName. Use this command if the exit from the called TML function depends on conditions that may not be reached. In this case, using function TS_Abort you can terminate the TML function execution and return to the next instruction after the call. The execution of a function called with TS_CancelableCALL_Label is signaled with bit SRL.8, when the function execution ends the bit is reset.

Prior calling the TS_CancelableCALL_Label function you have to:

- Create a TML function having the name pszFunctionName using EasyMotion Studio
- Select, in the Memory Setting dialogue, from where you want to run the TML program: TML program or non-volatile.
- Create the executable file (*.out) with the menu command Application | Motion | Build
- Generate the setup data (*.t.zip) for TML_lib using the menu command Application | Export to TML_lib… to include the new pszFunctionName
- Download the TML code in the drive/motor memory with EasyMotion Studio or function TS_DownloadProgram

Remarks:

1. You can call only one function at a time using the TS_CancelableCALL. Any cancelable call issued during the execution of a function called with TS_CancelableCALL is ignored. This situation is signaled with bit SRL.7.
2. For more details about drive/motor memory structure see the "Memory Map" topic from EasyMotion Studio help.
3. During the execution of a local TML program on the drive, any TML command sent on-line from the PC is treated with higher priority, and will be executed before executing the local TML code.

Related functions:  TS_DownloadProgram, TS_CALL, TS_CALL_Label, TS_CancelableCALL

Associated examples:  Ex05_Homing, Ex12_DistributedTasks
3.3.9.7 TS_ABORT

Prototype:

BOOL TML_EXPORT TS_Abort(void);

Arguments:

<table>
<thead>
<tr>
<th>Input</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>–</td>
<td>–</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>return</td>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function aborts the execution of a TML function launched with a cancelable call. The aborted function is selected with parameter pszFunctionName. The functions labels for a setup configuration are listed in the variables.cfg file.

Remark: The TML functions must be created with EasyMotion Studio prior generating the setup information.

Related functions: TS_DownloadProgram, TS_CancelableCALL, TS_CancelableCALL_Label

Associated examples: Ex05_Homing, Ex12_DistributedTasks
3.3.9.8  TS_DownloadProgram

Prototype:

BOOL TML_EXPORT TS_DownloadProgram(LPCSTR pszOutFile, WORD& wEntryPoint);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pszOutFile</td>
<td>The name of the COFF (*.out) file generated with EasyMotion Studio</td>
</tr>
<tr>
<td>wEntryPoint</td>
<td>Start address of downloaded file</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

**Description:** The function downloads a COFF formatted file to the drive/motor, and returns the entry point of the file. Parameter `pszOutFile` specifies the name of the file to be downloaded. If the operation is successful, the function will return the entry point (start address) of the downloaded code in the `wEntryPoint` parameter. The downloaded code can be launched with `TS_GOTO` function, the argument of the `TS_GOTO` being the `wEntryPoint` address.

The COFF file (*.out) is generated from EasyMotion Studio with the Application | Motion | Build menu command and is saved in the application directory. You can download several such applications in different locations of the drive internal memory, and execute them according to your application status, with the `TS_GOTO` function.

**Related functions:** `TS_GOTO`

**Associated examples:** Ex12_DistributedTasks
3.3.9.9 TS_DownloadSwFile

Prototype:

BOOL TML_EXPORT TS_DownloadSwFile(LPCSTR pszSwFile);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pszSwFile</td>
<td>The path to the SW file generated with EasyMotion Studio</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function downloads a software file (*.sw) to the non-volatile memory of drive/motor.

The software file (*.sw) contains the TML program and/or setup table and is generated from EasyMotion Studio with the Application | Create EEPROM Programmer File menu command. You can download several TML programs in different locations of the drive internal memory, and execute them according to your application structure, with the TS_GOTO or TS_CALL functions.

Remark: If a setup table is downloaded through a software file, it will become active after drive reset.

Related functions: TS_GOTO, TS_CALL

Associated examples: –
3.3.10 IO handling

3.3.10.1 TS_SetupInput

Prototype: BOOL TML_EXPORT TS_SetupInput(BYTE nIO);

Arguments:

<table>
<thead>
<tr>
<th>Input</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>nIO</td>
<td>Port number to be set as input</td>
</tr>
<tr>
<td>Output</td>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function sets the I/O port with number nIO of the drive/motor as an input port.

Use the function only if the input selected may also be used as an output. **Check the drive/motor user manual to find what inputs are available.** Do this operation only once, first time when you use the input. If the drive/motor has the inputs separated from the outputs (i.e. none of the input line can be used as output) you don't have to use the function.

Remark: Depending on the firmware version programmed on the drive/motor, FAxx or FBxx, the digital inputs and outputs are numbered as follows:

- From #0 to #39 for firmware FAxx\(^1\). The list is unordered, for example, a product with 4 inputs and 4 outputs can use the inputs: #36, #37, #38 and #39 and the outputs #28, #29, #30 and #31.
- From 0 to 15 for firmware version FBxx\(^2\). The list is ordered, for example, a product with 5 inputs and 3 outputs can use the inputs: 0, 1, 2, 3 and 4 and the outputs 0, 1, and 2.

Each intelligent drive/motor has a specific number of inputs and outputs, therefore only a part of the maximum number of I/Os is used.

Related functions: TS_GetInput, TS_SetupOutput, TS_SetOutput

Associated examples: Ex06_ExternalReference, Ex11_IOHandling, Ex12_DistributedTasks

---

\(^1\) Represents the firmware versions: F000H, F020H, F005H, F900H or later on Technosoft drives/motors: IDM240/IDM640, IDS240/IDS640, ISCM4805/ISCM8005, IBL2403, IM23x (models IS and MA).

\(^2\) Represents the firmware versions F5xxA or later on Technosoft drives/motors: IDM680 CANopen, iPAS family, iMOT family.
3.3.10.2 TS_GetInput

Prototype:

BOOL TML_EXPORT TS_GetInput(BYTE nIO, BYTE& InValue);

Arguments:

<table>
<thead>
<tr>
<th>Input</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>nIO</td>
<td>Input port number read</td>
</tr>
<tr>
<td>Output</td>
<td>InValue</td>
<td>Pointer to the variable where the port status is stored</td>
</tr>
<tr>
<td></td>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function returns the status of digital input port nIO. When the function is executed, the variable InValue, where the input line status is saved, becomes:

- Zero if the input line was low
- Non-zero if the input line was high

If the IO port selected can be used as input or an output then prior calling TS_GetInput you need to call TS_SetupInput and configure IO port as input. Check the drive/motor user manual to find what inputs are available.

Remark: Depending on the firmware version programmed on the drive/motor, FAxx or FBxx, the digital inputs and outputs are numbered as follows:

- From #0 to #39 for firmware FAxx\(^1\). The list is unordered, for example, a product with 4 inputs and 4 outputs can use the inputs: #36, #37, #38 and #39 and the outputs #28, #29, #30 and #31.
- From 0 to 15 for firmware version FBxx\(^2\). The list is ordered, for example, a product with 5 inputs and 3 outputs can use the inputs: 0, 1, 2, 3 and 4 and the outputs 0, 1, and 2.

Each intelligent drive/motor has a specific number of inputs and outputs, therefore only a part of the maximum number of I/Os is used.

Related functions: TS_SetupInput, TS_SetupOutput, TS_SetOutput

Associated examples: Ex06_ExternalReference, Ex11_IOHandling, Ex12_DistributedTasks

---

1 Represents the firmware versions: F000H, F020H, F005H, F900H or later on Technosoft drives/motors: IDM240/IDM640, IDS240/IDS640, ISCM4805/ISCM8005, IBL2403, IM23x (models IS and MA)
2 Represents the firmware versions F5xxA or later on Technosoft drives/motors: IDM680 CANopen, iPOS family, iMOT family.
3.3.10.3 TS_SetupOutput

Prototype:

BOOL TML_EXPORT TS_SetupOutput(BYTE nIO);

Arguments:

<table>
<thead>
<tr>
<th>Input</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nIO</td>
<td></td>
<td>Port number to be set as output</td>
</tr>
<tr>
<td>Output</td>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function configures the digital I/O port with number nIO of the drive/motor as an output port.

Use the function only if the output selected may also be used as an input. **Check the drive/motor user manual to find what outputs are available.** Do this operation only once, first time when you use the output. If the drive/motor has the outputs separated from the inputs (i.e. none of the output line can be used as an input) you don’t have to use the function.

Remark: Depending on the firmware version programmed on the drive/motor, FAxx or FBxx, the digital inputs and outputs are numbered as follows:

- from #0 to #39 for firmware **FAxx**\(^1\): The list is unordered, for example, a product with 4 inputs and 4 outputs can use the inputs: #36, #37, #38 and #39 and the outputs #28, #29, #30 and #31
- From 0 to 15 for firmware version **FBxx**\(^2\): The list is ordered, for example, a product with 5 inputs and 3 outputs can use the inputs: 0, 1, 2, 3 and 4 and the outputs 0, 1, and 2.

Each intelligent drive/motor has a specific number of inputs and outputs, therefore only a part of the maximum number of I/Os is used.

Related functions: TS_GetInput, TS_SetupOutput, TS_SetOutput

\(^2\) Represents the firmware versions F5xxA or later on Technosoft drives/motors: IDM680 CANopen, iPOS family, iMOT family.
3.3.10.4 TS_SetOutput

Prototype:

BOOL TML_EXPORT TS_SetOutput(BYTE nIO, BYTE OutValue);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nIO</td>
<td>Output port number to be written</td>
</tr>
<tr>
<td>OutValue</td>
<td>Output status value to be set</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function set/resets the status of digital output port nIO of the drive/motor. The port status IO_LOW or IO_HIGH is set corresponding to the value of the OutValue parameter.

If the IO port selected may also be used as input or an output then prior calling TS_SetOutput you need to call TS_SetupOutput and configure IO port as output.

Remark: Depending on the firmware version programmed on the drive/motor, FAxx or FBxx, the digital inputs and outputs are numbered as follows:

- from #0 to #39 for firmware FAxx\(^1\). The list is unordered, for example, a product with 4 inputs and 4 outputs can use the inputs: #36, #37, #38 and #39 and the outputs #28, #29, #30 and #31
- From 0 to 15 for firmware version FBxx\(^2\). The list is ordered, for example, a product with 5 inputs and 3 outputs can use the inputs: 0, 1, 2, 3 and 4 and the outputs 0, 1 and 2.

Each intelligent drive/motor has a specific number of inputs and outputs, therefore only a part of the maximum number of I/Os is used.

\(^1\) Represents the firmware versions F0xxH, F9xxH or later on Technosoft drives/motors: IDM240/IDM640, IDS240/IDS640, ISCM4805/ISCM8005, IBL2403, IM23x (models IS and MA).

\(^2\) Represents the firmware versions F5xxA or later on Technosoft drives/motors: IDM680 CANopen, iPOS family, iMOT family.
3.3.10.5 TS_GetHomeInput

Prototype:

BOOL TML_EXPORT TS_GetHomeInput(BYTE& InValue);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td></td>
</tr>
<tr>
<td>InValue</td>
<td>Pointer to the variable where the port status is stored</td>
</tr>
<tr>
<td>Output</td>
<td></td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

**Description**: The function returns the status of the general purpose digital input assigned as home input. **Check the drive/motor user manual to find the IO configuration.**

When the function is executed, the variable `InValue` where the input line status is saved becomes:

- Zero if the input line was low
- Non-zero if the input line was high

If the input port may also be used as output then prior calling `TS_GetHomeInput` you need to call `TS_SetupInput` and configure it as input.

**Related functions**: TS_SetupInput, TS_GetInput

**Associated examples**: Ex07_MultipleAxes
3.3.10.6 TS_GetMultipleInputs

Prototype:

BOOL TML_EXPORT TS_GetMultipleInputs(PCSTR pszVarName, SHORT& Status);

Arguments:

<table>
<thead>
<tr>
<th>Input</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>pszVarName</td>
<td>TML variable where the inputs status is saved</td>
</tr>
<tr>
<td>Output</td>
<td>Status</td>
<td>Pointer to variable where the value of pszVarName is stored</td>
</tr>
</tbody>
</table>

Description: The function reads simultaneously the status of more inputs and save their status in TML variable pszVarName on the drive/motor. The value of pszVarName is then uploaded from the drive and stored in Status variable.

For drives/motors programmed with firmware version FAxx\(^1\) the digital inputs read are:

- Enable input – saved in bit 15 of pszVarName
- Limit switch input for negative direction (LSN) – saved in bit 14 of pszVarName
- Limit switch input for positive direction (LSP) – saved in bit 13 of pszVarName
- General-purpose inputs #39, #38, #37 and #36 – saved in bits 3, 2, 1 and 0 of pszVarName

If the drive/motor is programmed with firmware version FBxx\(^2\) then the function reads all the input lines available of the drive/motor. The digital inputs are numbered from 0 to 15. The input's number represents also the position of the corresponding bit from the pszVarName, i.e. input number x has associated bit x from the pszVarName.

The Status bits corresponding to these inputs are set as follows: 0 if the input is low and 1 if the input is high. The other bits of the variable are set to 0.

Remark: If one of these inputs is inverted inside the drive/motor, the corresponding bit from the variable is inverted too. Hence, these bits always show the inputs status at connectors level (0 if input is low and 1 if input is high) even when the inputs are inverted.

The variable pszVarName is of type integer and must be defined with EasyMotion Studio before generating the setup data for TML_lib.

Related functions: TS_SetInput, TS_GetInput

Associated examples: Ex11_IOHandling

---

\(^1\) Represents the firmware versions F0xxH, F9xxH or later on Technosoft drives/motors: IDM240/IDM640, IDS240/IDS640, ISCM4805/ISCM8005, IBL2403, IM23x (models IS and MA).

\(^2\) Represents the firmware versions F5xxA or later on Technosoft drives/motors: IDM680 CANopen, iPOS family, iMOT family.
3.3.10.7 TS_SetMultipleOutputs

Prototype:

BOOL TML_EXPORT TS_SetMultipleOutputs(LPCSTR pszVarName, SHORT &Status);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pszVarName</td>
<td>Intermediary TML variable necessary to store the outputs status to be set on the drive/motor</td>
</tr>
<tr>
<td>Status</td>
<td>Parameter containing the outputs status to be set</td>
</tr>
</tbody>
</table>

Description: The function sets simultaneously more digital outputs of the drive/motor using the value of parameter Status. Its value is transferred and stored on the drive in pszVarName TML variable and from there is used to set the outputs.

Remark: The function is designed for drives/motors programmed with firmware version FAxx. For drives/motors programmed with firmware version FBxx use the TS_SetMultipleOutputs2 function.

The digital outputs are:

- Ready output – set by bit 15 of pszVarName
- Error output – set by bit 14 of pszVarName
- General-purpose outputs: #31, #30, #29, #28 – set by bits 3, 2, 1, and 0 of pszVarName

The outputs are set as follows: low if the corresponding bit in the variable is 0 and high if the corresponding bit in the variable is 1. The other bits of the variable are not used.

Remarks:

1. If one of these outputs is inverted inside the drive/motor, its command is inverted. Hence, the outputs are always set at connectors level according with the bits values (low if bit is 0 and high if bit is 1) even when the outputs are inverted.
2. The variable pszVarName must be declared with EasyMotion Studio prior generating the setup information

CAUTION: Do not use TS_SetMultipleOutputs if any of the 6 outputs mentioned is not on the list of available outputs of your drive/motor. There are products that use some of these outputs internally for other purposes. Attempting to change these lines status may harm your product.

Related functions: TS_SetupOutput, TS_SetOutput

Associated examples: Ex11_IOHandling

---

1 Represents the firmware versions F0xxH, F9xxH or later on Technosoft drives/motors: IDM240/IDM640, IDS240/IDS640, ISCM4805/ISCM8005, IBL2403, IM23x (models IS and MA).
2 Represents the firmware versions F5xxA or later on Technosoft drives/motors: IDM680 CANopen, iPOS family, iMOT family.
3.3.10.8 TS_SetMultipleOutputs2

Prototype:

BOOL TML_EXPORT TS_SetMultipleOutputs2(SHORT SelectedPorts, SHORT &Status);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SelectedPorts</td>
<td>Mask for selecting the outputs controlled. Each bit of the parameter represents an output port.</td>
</tr>
<tr>
<td>Status</td>
<td>Parameter containing the outputs status to be set</td>
</tr>
</tbody>
</table>

Return: TRUE if no error, FALSE if error

Description: The function sets simultaneously the digital outputs selected with the SelectedPorts mask using the value of the Status parameter.

Remark: The function is designed for drives/motors programmed with firmware version FBxx\(^1\). For drives/motors programmed with firmware version FAxx\(^2\) use the TS_SetMultipleOutputs function.

The digital outputs are numbered from 0 to 15 and they form an ordered list, for example, a product with 3 outputs will have 0, 1 and 2. The input's number represents also the position of the corresponding bit from the SelectedPorts mask, i.e. input number \(x\) has associated bit \(x\) from the SelectedPorts.

The outputs are set as follows:

- **low** if the corresponding bit from the SelectedPorts is 1 and the corresponding bit from Status variable is 0.
- **high** if it's the corresponding bit from SelectedPorts is 1 and the corresponding bit from SelectedPorts is 1.

Remarks: If one of these outputs is inverted inside the drive/motor, its command is inverted. Hence, the outputs are always set at connectors level according with the bits values (low if bit is 0 and high if bit is 1) even when the outputs are inverted.

Related functions: TS_SetupOutput, TS_SetOutput

Associated examples: –

3.3.11 Data transfer

3.3.11.1 TS_SetIntVariable

Prototype:

BOOL TML_EXPORT TS_SetIntVariable(LPCSTR pszName, SHORT value);

Arguments:

<table>
<thead>
<tr>
<th>Input</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>pszName</td>
<td>Parameter name</td>
</tr>
<tr>
<td></td>
<td>value</td>
<td>Parameter value</td>
</tr>
</tbody>
</table>

Output: return | TRUE if no error; FALSE if error

Description: The function writes the value in the pszName TML data on the active axis. The TML data (parameter, variable or user defined variable) is of type integer (16-bit).

Remarks:

1. The TML data available is configuration dependent and it is listed in the variables.cfg file from *.zip configuration description file.
2. The user defined variables are set with EasyMotion Studio prior generating the configuration description file.

Associated examples: Ex03_ErrorHandling, Ex06_ExternalReference, Ex12DistributedTasks
3.3.11.2 TS_GetIntVariable

Prototype:

BOOL TML_EXPORT TS_GetIntVariable(LPCSTR pszName, short& value);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pszName</td>
<td>Name of the TML parameter, variable or used defined variable</td>
</tr>
<tr>
<td>value</td>
<td>Pointer to the variable where the value is stored</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function reads the value of pszName TML data. The TML data (parameter, variable or user defined variable) is of type integer (16-bit). The value read is saved in the variable pointed by value.

Remarks:

1. The TML data available is configuration dependent and it is included in the variables.cfg file from *.t.zip configuration description file.
2. The user defined variables are set with EasyMotion Studio prior generating the configuration description file.

Related functions: TS_SetIntVariable, TS_SetLongVariable, TS_SetFixedVariable, TS_GetLongVariable, TS_GetFixedVariable

Associated examples: Ex03_ErrorHandling, Ex06_ExternalReference
3.3.11.3 TS_SetLongVariable

<td>Pointer to the variable where the parameter value is stored</td>
</tr>
<tr>
<td>Output</td>
<td></td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function reads the value of pszName TML data. The TML data (parameter, variable or user defined variable) is of type long (32-bit). The value read is saved in the variable pointed by value.

Remarks:

1. The TML data available is configuration dependent and is listed in the variables.cfg file from *t.zip configuration description file.
2. The user defined variables are set with EasyMotion Studio prior generating the configuration description file.

Related functions: TS_SetIntVariable, TS_SetLongVariable, TS_SetFixedVariable, TS_GetIntVariable, TS_GetFixedVariable

Associated examples: Ex04_BasicMove, Ex05_Homing, Ex10_EventHandling
3.3.11.5 TS_SetFixedVariable

Prototype:

BOOL TML_EXPORT TS_SetFixedVariable(LPCSTR pszName, DOUBLE value);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pszName</td>
<td>Name of the parameter</td>
</tr>
<tr>
<td>value</td>
<td>The value to be written</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function converts the value to type fixed and writes it in the pszName TML data on the active axis. The TML data (parameter, variable or user defined variable) is of type fixed (16 bits integer part, 16 bits fractional part).

Remarks:

1. The TML data available is configuration dependent and is listed in the variables.cfg file from *.zip configuration description file.
2. The user defined variables are set with EasyMotion Studio prior generating the configuration description file.

Related functions: TS_SetIntVariable, TS_GetIntVariable, TS_SetLongVariable, TS_GetLongVariable, TS_GetFixedVariable

Associated examples: Ex04_BasicMove, Ex05_Homing
3.3.11.6 TS_GetFixedVariable

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pszName</td>
<td>Name of the parameter</td>
</tr>
<tr>
<td>value</td>
<td>Pointer where the parameter value is stored</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function returns the address of pszName variable. The variable address is read from the configuration description file (*.t.zip) generated from EasyMotion Studio.

Related functions: TS_SetIntVariable, TS_SetLongVariable, TS_SetFixedVariable, TS_GetIntVariable, TS_GetLongVariable, TS_GetFixedVariable,

Associated examples: –
3.3.11.8 TS_SetBuffer

Prototype:

BOOL TML_EXPORT TS_SetBuffer(WORD address, WORD* arrayValues, WORD nSize);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td></td>
</tr>
<tr>
<td>address</td>
<td>Start address where to download the data buffer</td>
</tr>
<tr>
<td>arrayValues</td>
<td>Pointer to the array with data to be downloaded</td>
</tr>
<tr>
<td>nSize</td>
<td>The number of words to download</td>
</tr>
<tr>
<td>Output</td>
<td></td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function downloads a data buffer on the active axis. The parameter `arrayValues` points to the beginning of the array from where the data will be downloaded. The length of the buffer is set with parameter `nSize`. The data is stored on the drive/motor starting with `address`. The `address` can belong to non-volatile memory or TML data memory.

Remark: For details about drive/motor memory structure see the “Memory Map” topic from EasyMotion Studio on line help.

Related functions: TS_GetBuffer

Associated examples: –
3.3.11.9 TS_GetBuffer

Prototype:

BOOL TML_EXPORT TS_GetBuffer(WORD address, WORD* arrayValues, WORD nSize);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address</td>
<td>Start address from where the data will be uploaded</td>
</tr>
<tr>
<td>arrayValues</td>
<td>Pointer to the array where the uploaded data will be stored</td>
</tr>
<tr>
<td>nSize</td>
<td>The number of words to upload</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function uploads a data buffer from the active axis. The start address of the buffer is set with parameter address and its length is nSize. The address can belong to drive/motor non-volatile memory or TML data memory. The parameter arrayValues points to the beginning of the array where the uploaded data is stored.

Remark: For details about drive/motor memory structure see the “Memory Map” topic from EasyMotion Studio on line help.

Related functions: TS_SetBuffer

Associated examples: □
3.3.12 Miscellaneous

3.3.12.1 TS_Execute

Prototype:

BOOL TML_EXPORT TS_Execute(LPCSTR pszCommands);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pszCommands</td>
<td>String containing the TML source code to be executed.</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function executes the TML commands entered in TML source code format (as is send from the Command Interpreter, in EasyMotion Studio/EasySetUp), from a string containing that code. Use this function if you want to send a specific motion sequence, directly written in TML language.

Build a string pszCommands containing the source TML code and then call the TS_Execute function in order to compile the code and to send on-line the associated TML object commands.

If a compile error occurs, the function returns a FALSE, otherwise it returns TRUE.

Related functions: TS_ExecuteScript

Associated examples: Ex02_DriveStatus, Ex06_ExternalReference, Ex08_PVT
3.3.12.2 TS_ExecuteScript

Prototype:

BOOL TML_EXPORT TS_ExecuteScript(LPCSTR pszFileName);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pszFileName</td>
<td>The name of the file containing the TML source code to be executed.</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function executes TML commands entered in TML source code format (as is sent from the Command Interpreter in EasyMotion Studio/EasySetUp) from a script file. Use this function if you want to send a specific motion sequence, directly written in TML language.

Define a data file pszFileName containing the source TML code you want to send to the drive and then call the TS_ExecuteScript function in order to compile the code and to send on-line the associated TML object commands.

If a compile error occurs, the function returns a FALSE, otherwise it returns TRUE.

Related functions: TS_Execute

Associated examples: □
3.3.12.3 TS_GetOutputOfExecute

Prototype:

BOOL TML_EXPORT TS_GetOutputOfExecute(LPSTR pszOutput, int nMaxChars);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td></td>
</tr>
<tr>
<td>pszOutput</td>
<td>String containing the TML source code generated at the last</td>
</tr>
<tr>
<td></td>
<td>library function call.</td>
</tr>
<tr>
<td>Output</td>
<td></td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function returns the TML output source code of the last previously executed TML_LIB library function call. Use this function if you want to examine the binary code of the TML commands that are generated when you call one of the functions of the TML_LIB library.

The binary code is returned in the pszOutput string. Set the maximum number of characters to be returned as the value of the nMaxChars parameter.

Related functions: TS_Execute

Associated examples: –
3.3.13 Data logger

3.3.13.1 TS_SetupLogger

Prototype:

```c
BOOL TML_EXPORT TS_SetupLogger(WORD wLogBufferAddr, WORD wLogBufferLen, WORD* arrayAddresses, WORD countAddr, WORD period);
```

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wLogBufferAddr</td>
<td>The address of the logger buffer in drive/motor memory, where data will be stored during logging</td>
</tr>
<tr>
<td>wLogBufferLen</td>
<td>The length in words of the logger buffer</td>
</tr>
<tr>
<td>arrayAddresses</td>
<td>Pointer to the array containing the drive/motor memory addresses to be logged</td>
</tr>
<tr>
<td>countAddr</td>
<td>The number of memory addresses to be logged</td>
</tr>
<tr>
<td>period</td>
<td>Time interval between two consecutive data logging expressed in TML time units</td>
</tr>
</tbody>
</table>

**Description:** The function sets the parameters of the data logger on the active axis. Use this function if you want to perform data logging on the drive/motor during the motion execution and analyze it in the PC application.

Set the `wLogBufferAddress` parameter with the starting address of the drive RAM memory data buffer where a number of `wLogBufferLen` length data points of logged data will be stored.

The addresses of TML data logged are stored in an array of length `countAddr`. Parameter `arrayAddresses` points to the beginning of the array with.

**Remark** The number of data sets which can be stored will be determined as the integer part of the ratio \( \frac{\text{length}}{\text{countAddr}} \).

The parameter `period` sets how often the TML data is logged. The period can have any value between 1 and 7FFF.

**Remark:** Be careful when using the data logger functions! Incorrect settings related to data logger buffer location and size may lead to improper operation of the drive, with unpredictable results.

**Related functions:** TS_StartLogger, TS_UploadLoggerResults, TS_CheckLoggerStatus

**Associated examples:** Ex09_Logger
3.3.13.2 TS_StartLogger

Prototype:

BOOL TML_EXPORT TS_StartLogger(WORD wLogBufferAddr, BYTE type);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wLogBufferAddr</td>
<td>The address of the logger buffer in drive/motor memory, where data will be stored during logging</td>
</tr>
<tr>
<td>type</td>
<td>Specifies when the logging occurs</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function starts the data logger on the active axis. The function may be called only after the initialization of the data logger with the TS_SetupLogger function.

Use the parameter type to set if the data logging process must be done in the slow control loop (type = LOGGER_SLOW), or in the fast control loop (type = LOGGER_FAST).

Related functions: TS_SetupLogger, TS_UploadLoggerResults, TS_CheckLoggerStatus

Associated examples: Ex09_LOGGER
3.3.13.3 TS_CheckLoggerStatus

Prototype:

BOOL TML_EXPORT TS_CheckLoggerStatus(WORD& status);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wLogBufferAddr</td>
<td>The address of the logger buffer in drive/motor memory, where data will be stored during logging</td>
</tr>
<tr>
<td>status</td>
<td>Number of points still remaining to capture; if it is 0, the logging is completed</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function checks the data logger status on the active axis. Use this function in order to check if the data logging process is still running, or if the data logging process was ended. The function returns the status parameter, whose value indicates how many points are still to be captured. If status = 0 the data logging process is finished.

The function may be called only after the start of the logging process with the TS_StartLogger function.

Related functions: TS_SetupLogger, TS_StartLogger, TS_UploadLoggerResults

Associated examples: Ex09_Logger
3.3.13.4 TS_UploadLoggerResults

Prototype:

BOOL TML_EXPORT TS_UploadLoggerResults(WORD wLogBufferAddr, WORD* arrayValues, WORD& countValues);

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wLogBufferAddr</td>
<td>The address of the logger buffer in drive/motor memory, where data will be stored during logging</td>
</tr>
<tr>
<td>arrayValues</td>
<td>Pointer to the array where the uploaded data is stored on the PC</td>
</tr>
<tr>
<td>countValues</td>
<td>The size of arrayValues, expressed in WORDs</td>
</tr>
<tr>
<td>countValues</td>
<td>The number of uploaded data</td>
</tr>
<tr>
<td>return</td>
<td>TRUE if no error, FALSE if error</td>
</tr>
</tbody>
</table>

Description: The function uploads the data logged from the active axis. Use this function to upload the data stored during the data logger execution. Before calling the function, you must declare a data buffer in the PC program, starting at the arrayValues address, with a size equal to the countValues parameter.

The TS_UploadLoggerResults function will fill the arrayValues data buffer with the data transferred from the drive, and will also return the actual number of transferred data words, in the countValues parameter. Once the data is transferred, you can use it for data analysis, graphical representation.

Remark:
1. Prior uploading the data logged, call function TS_CheckLoggerStatus to test the end of data logging.
2. The number of data sets which were stored will be determined as the integer part of the ratio \( \text{length} / \text{countAddr} \) where length and countAddr are setup parameters defined when calling the TS_SetupLogger function

The uploaded data is stored in consecutive data sets, i.e. the first set of countAddr words will contain the first logged point for the selected variables, the second set of countAddr words will contain the second logged point for the selected variables, and so on. The following table illustrates this data structure for an example of 4 logged variables.

<table>
<thead>
<tr>
<th>Data WORD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Variable 1, point 1</td>
</tr>
<tr>
<td>2</td>
<td>Variable 2, point 1</td>
</tr>
<tr>
<td>3</td>
<td>Variable 3, point 1</td>
</tr>
<tr>
<td>4</td>
<td>Variable 4, point 1</td>
</tr>
<tr>
<td>5</td>
<td>Variable 1, point 2</td>
</tr>
<tr>
<td>6</td>
<td>Variable 2, point 2</td>
</tr>
<tr>
<td>7</td>
<td>Variable 3, point 2</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
</tr>
</tbody>
</table>

Related functions: TS_SetupLogger, TS_StartLogger, TS_CheckLoggerStatus

Associated examples: Ex09_Logger

4 Examples

This chapter presents a collection of applications which use the functions of the TML_LIB library to provide you a first, basic insight about using the TML_LIB library to implement your motion control applications.

Note that most of these examples contain function calls to TML_LIB functions, and are based on the hypothesis that the setup data is already downloaded into the non-volatile memory of the drive so that you'll directly start sending motion commands from the PC to the drive.

The examples are built for configurations with Technosoft drive IBL2403-CAN with brushless motor.

Remarks:

1. Prior running the examples, generate the setup data and modify the examples to accommodate the IO configuration of your drive/motor. Also, the examples are switching between position control and speed control, therefore during the Drive Setup phase enable all 3 control loops, current, speed and position, and tune the controllers.

2. The examples for Microsoft Windows platform, require the Working Directory to be set to the examples folder of the TML_lib, by default C:\Program Files\Technosoft\TML_LIB\examples\ For details about setting the Working Directory read the development environment online help.

3. For projects developed under Delphi and C#, the TML_lib.dll and tmlicom.dll must be present in the Output Directory of the project.

4. Most TML_LIB functions return a Boolean TRUE if the function executed correctly, and a FALSE if any error occurred (incorrect parameters, failed operation at the PC level). Normally, you must check after each function call if there was an error or not. In case of error use function TS_GetLastError to obtain a description of the error occurred.
4.1 Start Up

The example details the steps required to build the host application based on TML_lib. Before starting to build the host application you must setup the drive/motor accordingly with your application. The drive/motor setup is done using EasySetUp/EasyMotion Studio. When the setup is finished the host application must include the basic functionality:

3. Open communication channel using the **TS_OpenChannel**. The TML_lib library supports RS232, RS485, CAN and Ethernet communication.

4. Load the setup data for each axis controlled from the host with **TS_LoadSetup** function. The setup data must be generated from EasySetUp/EasyMotion Studio. The setup information is included in a *.t.zip file and is used by the library to validate your commands; it doesn’t contain the setup data downloaded in the drive non volatile memory.

5. Associate each axis with the setup information using the **TS_SetupAxis**. An axis is defined by its Axis ID and the setup information. The Axis ID is assigned to a drive/motor in the Drive setup dialog.

6. Select the destination of the commands sent from the host. For single axis applications the selection of the destination must be done once, after the axis setup. In multiaxis applications the **TS_SelectAxis** must be called every time the messages’ destination is changed.

7. Call **TS_DriveInitialization** function to check the integrity of the setup data downloaded in the non volatile memory of the drive. The setup data validation is performed automatically by the drive when it is powered. The **TS_DriveInitialization** function also signals the end of the drive initialization.

8. Enable the power stage of the drive with **TS_Power** function.

9. Send the motion commands required by your application using the functions included in the TML_lib.

10. When the application is finished, disable the power stage of the drive by calling the **TS_Power** function.

11. Close the communication channels using the **TS_CloseChannel** function. To close the current communication channel pass -1 to the **TS_CloseChannel**.
4.2 Drive status

The drive’s/motor’s key information is grouped in 2 status registers: Status Register (32-bit) and Motion Error Register (16-bit). The host can monitor the status of the drive/motor by:

- Requesting periodically the values of the status registers (SRL, SRH and MER) using the TS_ReadStatus function.
- Enable the drive to send automatically its status. The message transmission is triggered by conditions which change the status registers or the error register. The host selects the bits from the registers that will trigger a message, via 3 masks one for each register: SRL_MASK, SRH_MASK and MER_MASK.

The host analyse the message content in the user callback function, called automatically by the TML_lib when the host receives a message from the host.
4.3 Error handling

When an error occurs, the drive enters in the fault status. In the fault status the power stage is disabled, the MER register signals the error occurred and bit 15 from the SRH is set high to signal the fault state.

The normal operation of the drive can be restored by:

- calling the TS_ResetFault function. The function call must be followed by the TS_Power in order to enable the power stage of the drive. If the error persists then the drive will return to the fault state.

- resetting the drive using the TS_Reset function when the application depends on special routines to be executed, i.e homing routines. After a reset command the communication with the drive is disabled until the reset routines end. Hence the host application should add a delay before restoring the communication with the drive/motor. After the reset the drive communicates using the default baudrate, i.e. 9600bps for serial communication and 500kbps for CAN communication. If the host application was using a different baudrate before the reset then use MSK_SetBaudRate function to first set baudrate to the default values and then set it to the initial value.
4.4 Basic move

Technosoft drives/motors can execute a broad range of motion profiles. The example covers only the basic motion profiles like

- positionings with trapezoidal speed profile
- positionings with Scurve speed profiles
- velocity profiles

**Remark:** The example requires all control loops to be enabled. The control scheme is selected in the Drive Setup dialog. To enable all control loops first select Position in the Control mode, then open the Advanced dialog. In the Advanced dialog select the Close position, speed and current loop option and press the OK button.
4.5 Homing

Some application required a well defined starting point. This condition is achieved by calling a homing routine before beginning the main motion. The homing routine can be built:

- in the host application, the host calling the TML_lib functions required, or
- in EasyMotion Studio, using the TML language, then downloaded in the drive’s memory and launched from the host application.

The first part of the example calls a homing routine developed in EasyMotion Studio and downloaded in the drive’s non volatile memory. Before running the example:

- start EasyMotion Studio and establish the communication with the drive/motor
- restore the TML_lib Examples project from the TML_lib_examples.m.zip archive using the Project | Restore… menu command
- select the Ex05_Homing application and use the Application | Motion | Download Program menu command to download the homing routine in the non volatile memory of the drive/motor

After downloading the homing routine you can call it from the host application using the TS_CancelableCALL_Label.

Remark: When a TML function is called with the TS_CancelableCALL_Label function, the SRL.8 bit is set. The bit is reset when the function is finished. You should monitor the value of this bit to check the status of the homing routine.

In the second part of the example, a similar routine is executed by calling the functions included in the TML_lib library.
4.6 External reference

Thechnosoft drives/motors are capable to use external reference signals provided by other devices. There are 3 types of external references:

- Analogue – read by the drive/motor via a dedicated analogue input (10-bit resolution)
- Digital – computed by the drive/motor from:
  - Pulse & direction signals
  - Quadrature signals like A, B signals of an incremental encoder
- Online – received online via a communication channel from a host and saved in a dedicated TML variable

The example is split in 4 parts, one for each type of external reference and in the fourt the analog reference is used to compute a speed command.
4.7 Multiaxes

In multiaxes mode one of the drives acts as master providing the reference for the other drives. The drives/motors can operate in electronic gearing or electronic camming.

When set as master, in electronic gearing, the drive/motor sends its position via a multi-axis communication channel, like the CANbus. When set as slave, the drive/motor follows the master position with a programmable gear ratio.

In electronic camming the drive/motor set as master, sends its position via a multi-axis communication channel, and the drive/motor set as slave executes a cam profile function of the master position. The cam profile is defined by a cam table – a set of \((X, Y)\) points, where \(X\) is cam table input i.e. the master position and \(Y\) is the cam table output i.e. the corresponding slave position. Between the points the drive/motor performs a linear interpolation.

The first part of the example presents the steps required to set 2 drives in electronic gearing mode, one as master and the other as slave. The second part of the example illustrates the use of the cam table files and the phases required to set the electronic camming mode.
4.8 PVT – multithreading

In the PVT motion mode the built-in reference generator computes a positioning path using a series of points. Each point specifies the desired Position, Velocity and Time, i.e. contains a PVT data. Between the PVT points the reference generator performs a 3rd order interpolation.

The example walks through the steps required to set the PVT mode and use separates threads for each axis. The drives follow a complex path composed from lines and circles. The main thread computes the PVT points, then creates a thread for each axis. In the threads the host sends the PVT points and handles the PVT status received from the drives. When the trajectory is completed each thread closes the communication channel.
4.9 Logger

The Data Logger is an advanced graphical analysis tool, allowing you to do data acquisitions on any variable of your drive / motor and plot the results.

Please note that the uploaded data is stored alternatively. Also you have to take in consideration the type of the data received (integer, long, fixed) especially for fixed (16bit integer part. 16 bit fixed part) variables which must be converted from a 32-bit integer to float.
4.10 Event handling

An event is a programmable condition, which once set, is monitored for occurrence. Only a single event can be programmed at a time. You can do the following actions in relation with an event:

- Change the motion mode and/or the motion parameters, when the event occurs
- Stop the motion when the event occurs
- Wait for the programmed event to occur

The host application can:

- tests continuously the event status, and waits until the event occurs. There is a drawback of this situation, if the event will not occur, due to some unexpected conditions the program hangs-up in an internal loop waiting for the event to occur.
- Check periodically if the event occurred using the TS_CheckEvent function. In this way, you can detect if the event does not occur and eventually exit from the test loop after a given time period.
4.11 I/O handling

Each Technosoft drive/motor has a specific number of digital inputs and outputs. Some drives/motors include I/O lines that may be used either as inputs or as outputs. In these cases before using these lines, you need to specify how you want to use them by calling the TS_SetupInput and TS_SetupOutput functions.

Remarks:
- Read carefully the drive/motor user manual to find which I/O lines are available.
- You need to set an I/O line as input or output, only once, after power on

The I/O lines can be controlled individually or simultaneously; the example covers both cases.
4.12 Distributed tasks

The embedded intelligence of the drive/motor allows you to distribute the application between the host and the drives/motors in complex multi-axis applications. Thus, the host, instead of sending commands for each step of an axis movement, it can simply trigger the execution of a TML function, stored on the drive, and monitor the drive status. This approach allows the host to focus on system functionality, leaving the drive to handle the motion tasks.

The steps for building a distributed application are:

1. implement the TML functions using EasyMotion Studio
2. download the TML code on the drive:
   a. from EasyMotion Studio in the non volatile memory
   b. from the host application using the executable file (COFF) resulted after compiling the TML code. The COFF file can be downloaded with TS_DownloadProgram function.
   c. from the host application using the software file (sw) generated from EasyMotion Studio.
3. export the setup data for TML_lib. The setup data generated for TML_lib will contain the name of the TML functions created in EasyMotion Studio.
4. trigger, from the host, the execution of the TML functions by calling the TS_CancelableCALL_Lable function.
5. monitor the function execution status by requesting periodically the status registers or by enabling the drive to send its status automatically.

The example shows 2 possible ways of executing TML code developed using the EasyMotion Studio.
Appendix A Axis identification

The data exchanged on the communication channel is done using messages. Each message contains one TML instruction to be executed by the receiver of the message. Apart from the binary code of the TML instruction attached, any message includes information about its destination: an axis (drive/motor) or group of axes. Each drive/motor has its own 8-bit Axis ID and Group ID. This information is stored in TML variable AAR.

Remarks:
1. The Axis ID of a drive/motor must be unique and is set during the drive/motor setup phase with EasySetUp/EasyMotion Studio. The possible values for Axis ID are between 1 and 255.
2. In the TechnoCAN communication protocol the Axis ID is interpreted as modulo 32.
3. Use TS_GetIntVariable to read the value of the Axis ID and Group ID from the AAR (uint@0x030C) TML variable.

The Group ID represents a way to identify a group of axes, for a multicast transmission. This feature allows sending a command simultaneously to several axes, for example to start or stop the axes motion in the same time. When a function block sends a command to a group, all the axes members of this group will receive the command. For example, if the axis is member of group 1 and group 3, it will receive all the messages that in the group ID include group 1 and group 3.

Remarks:
1. A drive/motor belongs, by default, to the group ID = 1.
2. The TechnoCAN protocols supports up to 5 groups, possible Group ID values: 1 to 5

Each axis can be programmed to be member of one or several of the 8 possible groups.

Table 4.1 Definition of the groups

<table>
<thead>
<tr>
<th>Group No.</th>
<th>Group ID value</th>
</tr>

Appendix B Internal units and scaling factors

Technosoft drives/motors work with parameters and variables represented in internal units (IU). The parameters and variables may represent various signals: position, speed, current, voltage, etc. Each type of signal has its own internal representation in IU and a specific scaling factor. In order to easily identify each type of IU, these have been named after the associated signals. For example the position units are the internal units for position, the speed units are the internal units for speed, etc.

The scaling factor of each internal unit shows the correspondence with the international standard units (SI). The scaling factors are dependent on the product, motor and sensor type. Put in other words, the scaling factors depend on the setup configuration.

In order to find the internal units and the scaling factors for a specific configuration, use:

- Help | Help Topics | Setup Data Management | Internal Units and Scaling Factors menu command in EasySetUp
- Help | Help Topics | Application Programming Internal Units and Scaling Factors menu command in EasyMotion Studio

Important: The Internal Units and Scaling Factors topic provides customized information, function of the application setup. If you change the drive, the motor technology or the feedback device, check again the scaling factors with this command. It may show you other relations!
This page is empty
Appendix C CAM files format

The cam tables are arrays of X, Y points, where X is the cam input i.e. the master position and Y is the cam output i.e. the slave position. The X points are expressed in the master internal position units, while the Y points are expressed in the slave internal position units. Both X and Y points 32-bit long integer values. The X points must be positive (including 0) and equally spaced at: 1, 2, 4, 8, 16, 32, 64 or 128 i.e. having the interpolation step a power of 2 between 0 and 7. The maximum number of points for one cam table is 8192.

As cam table X points are equally spaced, they are completely defined by two data: the Master start value or the first X point and the Interpolation step providing the distance between the X points. This offers the possibility to minimize the cam size, which is saved in the drive/motor in the following format:

- 1st word (1 word = 16-bit data)
- Bits 15-13 - the power of 2 of the interpolation step. For example, if these bits have the binary value 010 (2), the interpolation step is $2^2 = 4$, hence the master X values are spaced from 4 to 4: 0, 4, 8, 12, etc.
- Bits 12-0 - the length -1 of the table. The length represents the number of points
- 2nd and 3rd words: the Master start value (long), expressed in master position units. 2nd word contains the low part, 3rd word the high part
- 4th and 5th words: Reserved. Must be set to 0
- Next pairs of 2 words: the slave Y positions (long), expressed in position units. The 1st word from the pair contains the low part and the 2nd word from the pair the high part
- Last word: the cam table checksum, representing the sum modulo 65536 of all the cam table data except the checksum word itself

Appendix F TML_LIB.h file

The TML_LIB.h file is the header file containing the prototypes of all TML_LIB functions, as well as all the constants needed to call functions of the library.

This file must be included in any C file that refers functions from TML_LIB. Use the TML_LIB.lib and the TML_LIB.dll to build the corresponding executable file.

```c
#ifndef __TML_LIB_H__
#define __TML_LIB_H__

LPCSTR TML_EXPORT TS_GetLastErrorText(void);
/
****
Function: Returns a text related to the last occurred error when one of
the library functions
was called.
Input arguments:
-
Output arguments:
return: A text related to the last occurred error
********
/
/**/

int TML_EXPORT TS_LoadSetup(LPCSTR setupPath);
/
****
Function: Load setup information from a zip archive or a directory
containing setup.cfg and variables.cfg files.
Input arguments:
setupPath: path to the zip archive or directory that
contains setup.cfg and variables.cfg of the given setup
Output arguments:
return: >=0 index of the loaded setup; -1 if error
********
/
/**/

int TML_EXPORT TS_OpenChannel(LPCSTR pszDevName, BYTE btType, BYTE
nHostID, DWORD baudrate);
/
****
Function: Open a communication channel.
Input arguments:
pszDevName: communication device name
RS232, RS485 and CHANNEL_LAWICEL_USBCAN: COM
port number or COM port name ("1","2","3"... -> "COM1", "COM2",
"COM3"...)
CHANNEL_IXXAT_CAN: "1" .. "4"
CHANNEL_SYS_TEC_USBCAN and CHANNEL_ESD_CAN: "0"
.. "10"
CHANNEL_PEAK_SYS_PCIE PCI: "1" or "2"
CHANNEL_LAWICEL_USBCAN: "" for the first device
found or the serial number of the device
CHANNEL_XPORT_IP: "IP" or "hostname"

© Technosoft 2017

TML_LIB – User Manual
btType: channel type (CHANNEL_*) with an optional protocol (PROTOCOL_*, default is PROTOCOL_TMLCAN)
nHostID: Is the address of your PC computer. A value between 1 and 255
For RS232: axis ID of the drive connected to the PC serial port (usually 255)
For RS485 or CAN devices: must be an unused axis ID! It is the address of your PC computer on the RS485 network.
For XPORT: "IP:port"
BaudRate: Baud rate serial ports: 9600, 19200, 38400, 56000 or 115200
CAN devices: 125000, 250000, 500000, 1000000

Output arguments:
return: channel's file descriptor or -1 if error

BOOL TML_EXPORT TS_SelectChannel(int fd);
/***************************************************************************************
Function: Select active communication channel. If you use only one channel there is no need to call this function.
Input arguments:
   fd: channel file descriptor (-1 means selected communication channel)
Output arguments:
   return: TRUE if no error; FALSE if error
***************************************************************************************/

   fd: channel file descriptor (-1 means selected communication channel)
***************************************************************************************/

BOOL TML_EXPORT TS_SetupAxis(BYTE axisID, int idxSetup);
/***************************************************************************************
Function: Select setup configuration for the drive with axis ID.
Input arguments:
   axisID: axis ID. It must be a value between 1 and 255;
   idxSetup: Index of previously loaded setup,
Output arguments:
   return: TRUE if no error; FALSE if error
BOOL TML_EXPORT TS_SelectAxis(BYTE axisID);
/*******************************
Function: Selects the active axis.
Input arguments:
axisID: The ID of the axis to become the active one. It must be a value between 1 and 255;
For RS485/CAN communication, this value must be different than nHostID parameter
defined at TS_OpenChannel function call.
Output arguments:
return: TRUE if no error; FALSE if error
*******************************

BOOL TML_EXPORT TS_SetupGroup(BYTE groupID, int idxSetup);
*******************************
Function: Select setup configuration for the drives within group.
Input arguments:
groupID: group ID. It must be a value between 1 and 8;
idxSetup: Index of previously loaded setup,
Output arguments:
return: TRUE if no error; FALSE if error
*******************************

BOOL TML_EXPORT TS_SelectGroup(BYTE groupID);
*******************************
Function: Selects the active group.
Input arguments:
groupID: The ID of the group of axes to become the active ones. It must be a value between 1 and 8.
Output arguments:
return: TRUE if no error; FALSE if error
*******************************

BOOL TML_EXPORT TS_SetupBroadcast(int idxSetup);
*******************************
Function: Select setup configuration for all drives on the active channel.
Input arguments:
idxSetup: Index of previously loaded setup,
Output arguments:
return: TRUE if no error; FALSE if error
*******************************

BOOL TML_EXPORT TS_SelectBroadcast(void);
*******************************
Function: Selects all axis on the active channel.
return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_UpdateImmediate(void);

Function: Update the motion mode immediately.
Output arguments:
    return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_UpdateOnEvent(void);

Function: Update the motion mode on next event occurrence.
Output arguments:
    return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_SetPosition(long PosValue);

Function: Set the actual position value.
Input arguments:
    PosValue: Value at which the position is set
Output arguments:
    return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_SetCurrent(short CrtValue);

Function: Set the actual current value.
Input arguments:
    CrtValue: Value at which the motor current is set
               REMARK: this command can be used only for step motor drives
Output arguments:
    return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_SetTargetPositionToActual(void);

Function: Set the target position value equal to the actual position value.
Output arguments:
    return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_SetIntVariable(LPCSTR pszName, short value);

Function: Writes an integer type variable to the drive.
Input arguments:
    pszName: Name of the variable
    value: Variable value
Output arguments:

arrayValues: Buffer address where the uploaded data will be stored
nSize: the number of words to upload
Output arguments:
arrayValues: the uploaded data
return: TRUE if no error; FALSE if error
***********************************************************************/

/****************************MOTION functions****************************/
BOOL TML_EXPORT TS_MoveAbsolute(long AbsPosition, double Speed, double Acceleration, short MoveMoment, short ReferenceBase);
/***********************************************************************
Function: Move Absolute with trapezoidal speed profile. This function allows you to program a position profile with a trapezoidal shape of the speed.
Input arguments:
AbsPosition: Absolute position reference value
Speed: Slew speed; if 0, use previously defined value
Acceleration: Acceleration deceleration; if 0, use previously defined value

MoveMoment:
- UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command)
- UPDATE_IMMEDIATE -> start moving immediate
- UPDATE_ON_EVENT -> start moving on event

ReferenceBase:
- FROM_MEASURE -> the position reference starts from the actual measured position value
- FROM_REFERENCE -> the position reference starts from the actual reference position value

Output arguments:
- return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_MoveRelative(long RelPosition, double Speed, double Acceleration, BOOL IsAdditive, short MoveMoment, short ReferenceBase);

Function: Move Relative with trapezoidal speed profile. This function allows you to program a position profile with a trapezoidal shape of the speed.

Input arguments:
- RelPosition: Relative position reference value
- Speed: Slew speed; if 0, use previously defined value
- Acceleration: Acceleration deceleration; if 0, use previously defined value
- MoveMoment:
- UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command)
- UPDATE_IMMEDIATE -> start moving immediate
- UPDATE_ON_EVENT -> start moving on event
- IsAdditive:
- TRUE -> Add the position increment to the position to reach set by the previous motion command
- FALSE -> No position increment is added to the target position
- ReferenceBase:
- FROM_MEASURE -> the position reference starts from the actual measured position value
- FROM_REFERENCE -> the position reference starts from the actual reference position value

Output arguments:
- return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_MoveVelocity(double Speed, double Acceleration, short MoveMoment, short ReferenceBase);

Function: Move at a given speed, with acceleration profile.
**Speed:** Jogging speed

**Acceleration:** Acceleration decceleration; if 0, use previously defined value

**MoveMoment:**
- UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command)
- UPDATE_IMMEDIATE -> start moving immediate
- UPDATE_ON_EVENT -> start moving on event

**ReferenceBase:**
- FROM_MEASURE -> the position reference starts from the actual measured position value
- FROM_REFERENCE -> the position reference starts from the actual reference position value

**Output arguments:**
- return: TRUE if no error; FALSE if error

---

```c
BOOL TML_EXPORT TS_SetAnalogueMoveExternal (short ReferenceType, BOOL UpdateFast, double LimitVariation, short MoveMoment);
```

**Function:** Set Motion type as using an analogue external reference.

**Input arguments:**
- **ReferenceType:**
  - REFERENCE_POSITION -> external position reference
  - REFERENCE_SPEED -> external speed reference
  - REFERENCE_TORQUE -> external torque reference
  - REFERENCE_VOLTAGE -> external voltage reference
- **UpdateFast:**
  - TRUE -> generate the torque reference in the fast control loop
  - FALSE -> generate the torque reference in the slow control loop
- **LimitVariation:**
  - NO_VARIATION (0) -> the external reference is limited at the value set in the Drive Setup
  - A value which can be an acceleration or speed in function of the reference type.
- **MoveMoment:**
  - UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command)
  - UPDATE_IMMEDIATE -> start moving immediate
  - UPDATE_ON_EVENT -> start moving on event

**Output arguments:**
- return: TRUE if no error; FALSE if error

---

```c
#ifdef __cplusplus
BOOL TML_EXPORT TS_SetDigitalMoveExternal (BOOL SetGearRatio = FALSE, short Denominator = 1, short Numerator = 1, double LimitVariation = 0, short MoveMoment = 1);
#else
#endif
```
BOOL TML_EXPORT TS_SetDigitalMoveExternal (BOOL SetGearRatio, short Denominator, short Numerator, double LimitVariation, short MoveMoment);

Function: Set Motion type as using a digital external reference. This function is used only for Positioning.
Input arguments:
- MoveMoment:
  UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command)
  UPDATE_IMMEDIATE -> start moving immediate
  UPDATE_ON_EVENT -> start moving on event
- LimitVariation:
  NO_VARIATION (0) -> the external reference is limited at the value set in the Drive Setup
  A value which can be an acceleration or speed in function of the reference type.
- SetGearRatio: Set the gear parameters; if TRUE, following parameters are needed
  Denumerator: Gear master ratio
  Numerator: Gear slave ratio
Output arguments:
- return: TRUE if no error; FALSE if error

#ifndef __cplusplus
BOOL TML_EXPORT TS_SetOnlineMoveExternal (short ReferenceType, double LimitVariation = 0, double InitialValue = 0., short MoveMoment = 1);
#else
BOOL TML_EXPORT TS_SetOnlineMoveExternal (short ReferenceType, double LimitVariation, double InitialValue, short MoveMoment);
#endif

Function: Set Motion type as using an analogue external reference.
Input arguments:
- ReferenceType:
  REFERENCE_POSITION -> external position reference
  REFERENCE_SPEED -> external speed reference
  REFERENCE_TORQUE -> external torque reference
  REFERENCE_VOLTAGE -> external voltage reference
- LimitVariation:
  NO_VARIATION (0) -> the external reference is limited at the value set in the Drive Setup
  A value which can be an acceleration or speed in function of the reference type.
- MoveMoment:
  UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command)
  UPDATE_IMMEDIATE -> start moving immediate
  UPDATE_ON_EVENT -> start moving on event
- InitialValue: If non zero, set initial value of EREF
Output arguments:
return: TRUE if no error; FALSE if error
***************************************************************/

BOOL TML_EXPORT TS_VoltageTestMode(short MaxVoltage, short IncrVoltage, short Theta0, short Dtheta, short MoveMoment);
/*-----------------------------------------------*/

Function: Use voltage test mode.
Input arguments:
MaxVoltage: Maximum test voltage value
IncrVoltage: Voltage increment on each slow sampling period
Theta0: Initial value of electrical angle value
Remark: used only for AC motors; set to 0
otherwise
Dtheta: Electric angle increment on each slow sampling period
MoveMoment:
UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command)
UPDATE_IMMEDIATE -> start moving immediate
UPDATE_ON_EVENT -> start moving on event
Output arguments:
return: TRUE if no error; FALSE if error
***************************************************************/

BOOL TML_EXPORT TS_TorqueTestMode(short MaxTorque, short IncrTorque, short Theta0, short Dtheta, short MoveMoment);
/*-----------------------------------------------*/

Function: Use torque test mode.
Input arguments:
MaxTorque: Maximum test torque value
IncrTorque: Torque increment on each slow sampling period
Theta0: Initial value of electrical angle value
Remark: used only for AC motors; set to 0
otherwise
Dtheta: Electric angle increment on each slow sampling period
MoveMoment:
UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command)
UPDATE_IMMEDIATE -> start moving immediate
UPDATE_ON_EVENT -> start moving on event
Output arguments:
return: TRUE if no error; FALSE if error
***************************************************************/

BOOL TML_EXPORT TS_SetGearingMaster(BOOL Group, BYTE SlaveID, short ReferenceBase, BOOL Enable, BOOL SetSlavePos, short MoveMoment);
/*-----------------------------------------------*/

Function: Setup master parameters in gearing mode.
Input arguments:
Group
TRUE -> set slave group ID with value;
FALSE-> set slave axis ID with SlaveID value;
SlaveID:  
Axis ID in the case that Group is FALSE or a
Group ID when Group is TRUE
ReferenceBase:
  FROM_MEASURE -> send position feedback
  FROM_REFERENCE -> send position reference
Enable:
 disable gearing operation
SetSlavePos:  TRUE -> initialize slave(s) with master position
MoveMoment:  
start latter (on an Update command)
  UPDATE_NONE -> setup motion parameters, movement will
  UPDATE_IMMEDIATE -> start moving immediate
  UPDATE_ON_EVENT -> start moving on event
Output arguments:  
return:  TRUE if no error; FALSE if error
******************************************************************************

BOOL TML_EXPORT TS_SetGearingSlave(short Denominator, short Numerator, 
  short ReferenceBase, 
  short EnableSlave, double LimitVariation, short MoveMoment);
Function: Setup slave parameters in gearing mode.
Input arguments:
  Denominator:  Master gear ratio value
  Numerator:  Slave gear ratio value
  ReferenceBase:
   FROM_MEASURE -> the position reference starts from the
   actual measured position value
   FROM_REFERENCE -> the position reference starts from the
   actual reference position value
  EnableSlave:
   SLAVE_NONE -> do not enable slave operation
   SLAVE_COMMUNICATION_CHANNEL -> enable operation got via
   a communication channel
   SLAVE_2ND_ENCODER -> enable operation read from 2nd
   encoder or P&D inputs
  LimitVariation:
   NO_VARIATION (0) -> the external reference is limited at
   the value set in the Drive Setup
   A value which can be an acceleration or speed in
   function of the reference type.
  MoveMoment:  
  UPDATE_NONE -> setup motion parameters, movement will
  start latter (on an Update command)
  UPDATE_IMMEDIATE -> start moving immediate
  UPDATE_ON_EVENT -> start moving on event
Output arguments:  
return:  TRUE if no error; FALSE if error
******************************************************************************
BOOL TML_EXPORT TS_MotionSuperposition(short Enable, short Update);

Function: enable or disable the superposition of the electronic gearing mode with a second motion mode

Input arguments:
Enable: if 0, disable the Superposition mode
if 1, enable the Superposition mode
Update: if 0, doesn't send UPD command to the drive, in order to take into account the Superposition mode
if 1, sends UPD command to the drive, in order to take into account the Superposition mode

Output arguments:
return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_SetCammingMaster(BOOL Group, BYTE SlaveID, short ReferenceBase, BOOL Enable, short MoveMoment);

Function: Setup master parameters in camming mode.

Input arguments:
Group
TRUE -> set slave group ID with (SlaveID + 256) value;
FALSE -> set slave axis ID with SlaveID value;
SlaveID: Axis ID in case Group is FALSE, or group mask otherwise (0 means broadcast)
ReferenceBase:
FROM_MEASURE -> send position feedback
FROM_REFERENCE -> send position reference
Enable:
TRUE -> enable camming operation; FALSE -> disable camming operation
MoveMoment:
UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command)
UPDATE_IMMEDIATE -> start moving immediate
UPDATE_ON_EVENT -> start moving on event

Output arguments:
return: TRUE if no error; FALSE if error

#ifdef __cplusplus
BOOL TML_EXPORT TS_CamDownload(LPCSTR pszCamFile, WORD wLoadAddress, WORD wRunAddress, WORD& wNextLoadAddr, WORD& wNexRunAddr);
#else
BOOL TML_EXPORT TS_CamDownload(LPCSTR pszCamFile, WORD wLoadAddress, WORD wRunAddress, WORD* wNextLoadAddr, WORD* wNexRunAddr);
#endif

Function: Download a CAM file to the drive, at a specified address.
Input arguments:
- pszCamFile: the name of the file containing the CAM information
- wLoadAddress: memory address where the CAM is loaded
- wRunAddress: memory where the actual CAM table is transferred and executed at run time

Output arguments:
- wNextLoadAddr: memory address available for the next CAM file; if 0 there is no memory left
- wNextRunAddress: memory where the next CAM table is transferred and executed at run time;
- return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_CamInitialization(WORD LoadAddress, WORD RunAddress);

Function: Copies a CAM file from E2ROM to RAM memory. You should not use this if you download CAMs directly to RAM memory (load address == run address)

Input arguments:
- LoadAddress: memory address in E2ROM where the CAM is already loaded
- RunAddress: memory address in RAM where the CAM is copied.

Output arguments:
- return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_CamInitialization(WORD LoadAddress, WORD RunAddress);

Function: Copies a CAM file from E2ROM to RAM memory. You should not use this if you download CAMs directly to RAM memory (load address == run address)

Input arguments:
- LoadAddress: memory address in E2ROM where the CAM is already loaded
- RunAddress: memory address in RAM where the CAM is copied.

Output arguments:
- return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_CamInitialization(WORD LoadAddress, WORD RunAddress);

Function: Copies a CAM file from E2ROM to RAM memory. You should not use this if you download CAMs directly to RAM memory (load address == run address)

Input arguments:
- LoadAddress: memory address in E2ROM where the CAM is already loaded
- RunAddress: memory address in RAM where the CAM is copied.

Output arguments:
- return: TRUE if no error; FALSE if error

#define __cplusplus
BOOL TML_EXPORT TS_SetCammingSlaveRelative(WORD RunAddress, short ReferenceBase, short EnableSlave, short MoveMoment,
                                          long OffsetFromMaster = 0, double MultInputFactor = 0,
                                          double MultOutputFactor = 0);
#endif

BOOL TML_EXPORT TS_SetCammingSlaveRelative(WORD RunAddress, short ReferenceBase, short EnableSlave, short MoveMoment,
                                          long OffsetFromMaster, double MultInputFactor, double MultOutputFactor);
#endif

Function: Setup slave parameters in relative camming mode.

Input arguments:
- RunAddress: memory addresses where the CAM is executed at run time. If any of them is 0 it means that no start address is set
- ReferenceBase:
  - FROM_MEASURE -> the position reference starts from the actual measured position value
  - FROMREFERENCE -> the position reference starts from the actual reference position value
- EnableSlave:
  - SLAVE_NONE -> do not enable slave operation
SLAVE_COMMUNICATION_CHANNEL -> enable operation got via a communication channel
SLAVE_2ND_ENCODER -> enable operation read from 2nd encoder or P&D inputs
MoveMoment:
   UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command)
   UPDATE_IMMEDIATE -> start moving immediate
   UPDATE_ON_EVENT -> start moving on event
nOffsetFromMaster, nMultInputFactor, nMultOutputFactor: if non-zero, set the correspondent parameter
Output arguments:
   return: TRUE if no error; FALSE if error
***********************************************************************/

#ifdef __cplusplus
BOOL TML_EXPORT TS_SetCammingSlaveAbsolute(WORD RunAddress,
double LimitVariation, short ReferenceBase, short EnableSlave, short
MoveMoment,

#else
BOOL TML_EXPORT TS_SetCammingSlaveAbsolute(WORD RunAddress,
double LimitVariation, short ReferenceBase, short EnableSlave, short
MoveMoment,
   long OffsetFromMaster, double MultInputFactor, double
MultOutputFactor);
#endif

/**************************
Function: Setup slave parameters in absolute camming mode.
Input arguments:
   RunAddress: memory addresses where the CAM is executed at run time. If any of them is 0 it means that no start address is set
   LimitVariation:
      NO_VARIATION (0) -> no limitation on speed value at the value set in the Drive Setup
      A value which can be an acceleration or speed in function of the reference type.
   ReferenceBase:
      FROM_MEASURE -> the position reference starts from the actual measured position value
      FROM_REFERENCE -> the position reference starts from the actual reference position value
   EnableSlave:
      SLAVE_NONE -> do not enable slave operation
      SLAVE_COMMUNICATION_CHANNEL -> enable operation got via a communication channel
      SLAVE_2ND_ENCODER -> enable operation read from 2nd encoder or P&D inputs
   MoveMoment:
***********************************************************************/
UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command).
UPDATE_IMMEDIATE -> start moving immediate
UPDATE_ON_EVENT -> start moving on event

n_OffsetFromMaster, n_MultInputFactor, n_MultOutputFactor: if non-zero, set the correspondent parameter
Output arguments:
    return: TRUE if no error; FALSE if error

***********************************************************************

BOOL TML_EXPORT TS_SetMasterResolution(long MasterResolution);
Function: Setup the resolution for the master encoder connected on the second encoder input of the drive.
Input arguments:
    MasterResolution:
        FULL_RANGE (0) -> select this option if the master position is not cyclic. (e.g. the resolution is equal with the whole 32-bit range of position)
        Value that represents the number of lines of the 2nd master encoder
Output arguments:
    return: TRUE if no error; FALSE if error
***********************************************************************

BOOL TML_EXPORT TS_SendSynchronization (long Period);
Function: Setup drives to send synchronization messages.
Input arguments:
    Period: the time period between 2 sends
Output arguments:
    return: TRUE if no error; FALSE if error
***********************************************************************

BOOL TML_EXPORT TS_Stop(void);
Function: Stop the motion.
Output arguments:
    return: TRUE if no error; FALSE if error
***********************************************************************

BOOL TML_EXPORT TS_QuickStopDecelerationRate(double Deceleration);
Function: Set the deceleration rate used for QuickStop or S Curve positioning profile.
Input Arguments:
    Deceleration: the value of the deceleration rate
Output arguments:
    return: TRUE if no error; FALSE if error
***********************************************************************
BOOL TML_EXPORT TS_SendPVTPoint(long Position, double Velocity, unsigned int Time, short PVTCounter);

Function: Sends a PVT point to the drive.
Input arguments:
  Position: drive position for the desired point
  Velocity: desired velocity of the drive at the point
  Time: amount of time for the segment
  PVTCounter: integrity counter for current PVT point
Output arguments:
  return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_SendPVTFirstPoint(long Position, double Velocity, unsigned int Time, short PVTCounter, short PositionType, long InitialPosition, short MoveMoment, short ReferenceBase);

Function: Sends the first point from a series of PVT points and sets the PVT motion mode.
Input arguments:
  Position: drive position for the desired point
  Velocity: desired velocity of the drive at the point
  Time: amount of time for the segment
  PVTCounter: integrity counter for current PVT point
  PositionType: ABSOLUTE_POSITION or RELATIVE_POSITION
  InitialPosition: drive initial position at the start of an absolute PVT movement.
  MoveMoment:
    UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command)
    UPDATE_IMMEDIATE -> start moving immediate
    UPDATE_ON_EVENT -> start moving on event
  ReferenceBase:
    FROM_MEASURE -> the position reference starts from the actual measured position value
    FROM_REFERENCE -> the position reference starts from the actual reference position value
Output arguments:
  return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_PVTSetup(short ClearBuffer, short IntegrityChecking, short ChangePVTCounter, short AbsolutePositionSource, short ChangeLowLevel, short PVTCounterValue, short LowLevelValue);
Function: For PVT motion mode parametrization and setup.
Input arguments:
  ClearBuffer: 0 -> nothing
    1 -> clears the PVT buffer
  IntegrityChecking: 0 -> PVT integrity counter checking is active (default)
    1 -> PVT integrity counter checking is inactive
  ChangePVTCounter: 0 -> nothing
    1 -> drive internal PVT integrity counter is changed with the value specified PVTCounterValue
  AbsolutePositionSource: specifies the source for the initial position in case the PVT motion mode will be absolute
    0 -> initial position read from PVTPOS0
    1 -> initial position read from current value of target position (TPOS)
  ChangeLowLevel: 0 -> nothing
    1 -> the parameter for BufferLow signaling is changed with the value specified LowLevelValue
  PVTCounterValue: New value for the drive internal PVT integrity counter
  LowLevelValue: New value for the level of the BufferLow signal
Output arguments:
  return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_SendPTPoint(long Position, unsigned int Time, short PTCounter);

Function: Sends a PT point to the drive.
Input arguments:
  Position: drive position for the desired point
  Time: amount of time for the segment
  PTCounter: integrity counter for current PT point
Output arguments:
  return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_SendPTFirstPoint(long Position, unsigned int Time, short PTCounter, short PositionType, long InitialPosition, short MoveMoment, short ReferenceBase);

Function: Sends the first point from a series of PT points and sets the PT motion mode.
Input arguments:
  Position: drive position for the desired point
  Time: amount of time for the segment
  PTCounter: integrity counter for current PT point
  PositionType: ABSOLUTE_POSITION or RELATIVE_POSITION
InitialPosition: drive initial position at the start of an absolute PT movement. It is taken into consideration only if an absolute movement is requested.

MoveMoment:
- UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command)
- UPDATE_IMMEDIATE -> start moving immediate
- UPDATE_ON_EVENT -> start moving on event

ReferenceBase:
- FROM_MEASURE -> the position reference starts from the actual measured position value
- FROM_REFERENCE -> the position reference starts from the actual reference position value

Output arguments:
return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_PTSetup(short ClearBuffer, short IntegrityChecking, short ChangePTCounter, short AbsolutePositionSource, short ChangeLowLevel, short PTCounterValue, short LowLevelValue);

Function: For PT motion mode parametrization and setup.
Input arguments:
ClearBuffer: 0 -> nothing
1 -> clears the PT buffer
IntegrityChecking: 0 -> PT integrity counter checking is active (default)
1 -> PT integrity counter checking is inactive
ChangePTCounter: 0 -> nothing
1 -> drive internal PT integrity counter is changed with the value specified PTCounterValue
AbsolutePositionSource: specifies the source for the initial position in case the PT motion mode will be absolute
0 -> initial position read from PVTPOS0
1 -> initial position read from current value of target position (TPOS)
ChangeLowLevel: 0 -> nothing
1 -> the parameter for BufferLow signaling is changed with the value specified LowLevelValue
PTCounterValue: New value for the drive internal PT integrity counter
LowLevelValue: New value for the level of the BufferLow signal

Output arguments:
return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_MoveSCurveRelative(long RelPosition, double Speed, double Acceleration, long JerkTime, short MoveMoment, short DecelerationType);

Function: For relative S-Curve motion mode.
Input arguments:
- RelPosition: Relative position reference value
- Speed: Slew speed
- Acceleration: Acceleration deceleration
- JerkTime: The time after the acceleration reaches the desired value.
- MoveMoment: UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command)
  - UPDATE_IMMEDIATE -> start moving immediate
  - UPDATE_ON_EVENT -> start moving on event
- DecelerationType:
  - S_CURVE_SPEED_PROFILE -> s-curve speed profile
  - TRAPEZOIDAL_SPEED_PROFILE -> trapezoidal speed profile

Output arguments:
- return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_MoveSCurveAbsolute(long AbsPosition, double Speed, double Acceleration, long JerkTime, short MoveMoment, short DecelerationType);

/***************************************************************************/
Function: For absolute S-Curve motion mode.
Input arguments:
- AbsPosition: Absolute position reference value
- Speed: Slew speed
- Acceleration: Acceleration deceleration
- JerkTime: The time after which the acceleration reaches the desired value.
- MoveMoment: UPDATE_NONE -> setup motion parameters, movement will start latter (on an Update command)
  - UPDATE_IMMEDIATE -> start moving immediate
  - UPDATE_ON_EVENT -> start moving on event
- DecelerationType:
  - S_CURVE_SPEED_PROFILE -> s-curve speed profile
  - TRAPEZOIDAL_SPEED_PROFILE -> trapezoidal speed profile

Output arguments:
- return: TRUE if no error; FALSE if error

***************************************************************************/

BOOL TML_EXPORT TS_SetEventOnLoadSpeed(double Speed, BOOL Over, BOOL WaitEvent, BOOL EnableStop);

Function: Setup event when load speed is over/under imposed value.
Input arguments:
  Speed: Speed value to be reached
  Over: TRUE -> Look for speed over; FALSE -> Look for speed below
  WaitEvent: TRUE -> Wait until event occurs; FALSE -> Continue
  EnableStop: TRUE -> On event, stop the motion; FALSE -> Don't stop the motion
Output arguments:
  return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_SetEventOnTime(WORD Time, BOOL WaitEvent, BOOL EnableStop);

Function: Setup event after a time interval.
Input arguments:
  Time: Time after which the event will be set
  WaitEvent: TRUE -> Wait until event occurs; FALSE -> Continue
  EnableStop: TRUE -> On event, stop the motion; FALSE -> Don't stop the motion
Output arguments:
  return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_SetEventOnPositionRef(long Position, BOOL Over, BOOL WaitEvent, BOOL EnableStop);

Function: Setup event when position reference is over/under imposed value.
Input arguments:
BOOL TML_EXPORT TS_SetEventOnSpeedRef(double Speed, BOOL Over, BOOL WaitEvent, BOOL EnableStop);

Function: Setup event when speed reference is over/under imposed value.
Input arguments:
  Speed: Speed value to be reached
  Over: TRUE -> Look for speed over; FALSE -> Look for speed below
  WaitEvent: TRUE -> Wait until event occurs; FALSE -> Continue
  EnableStop: TRUE -> On event, stop the motion, FALSE -> Don't stop the motion
Output arguments:
  return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_SetEventOnTorqueRef(int Torque, BOOL Over, BOOL WaitEvent, BOOL EnableStop);

Function: Setup event when torque reference is over/under imposed value.
Input arguments:
  Torque: Torque value to be reached
  Over: TRUE -> Look for speed over; FALSE -> Look for speed below
  WaitEvent: TRUE -> Wait until event occurs; FALSE -> Continue
  EnableStop: TRUE -> On event, stop the motion, FALSE -> Don't stop the motion
Output arguments:
  return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_SetEventOnEncoderIndex(short IndexType, short TransitionType, BOOL WaitEvent, BOOL EnableStop);

Function: Setup event when encoder index is triggered.
Input arguments:
  IndexType: INDEX_1 or INDEX_2
  TransitionType: TRANSITION_HIGH_TO_LOW or TRANSITION_LOW_TO_HIGH
Output arguments:
  return: TRUE if no error; FALSE if error
BOOL TML_EXPORT TS_SetEventOnLimitSwitch(short LSWType, short TransitionType, BOOL WaitEvent, BOOL EnableStop);

Function: Setup event when selected limit switch is triggered.
Input arguments:
LSWType: LSW_NEGATIVE or LSW_POSITIVE
TransitionType: TRANSITION_LOW_TO_HIGH or TRANSITION_HIGH_TO_LOW
WaitEvent: TRUE -> Wait until event occurs; FALSE -> Continue
EnableStop: TRUE -> On event, stop the motion, FALSE -> Don't stop the motion
Output arguments:
return: TRUE if no error; FALSE if error

BOOL TML_EXPORT TS_Execute(LPCSTR pszCommands);

Function: Execute TML commands entered in TML source code format (as is entered in Command Interpreter).
Input arguments: pszCommands: String containing the TML source code to be executed. Multiple lines are allowed.
Output arguments: return: TRUE if no error; FALSE if error
******************************************************************************

BOOL TML_EXPORT TS_ExecuteScript(LPCSTR pszFileName);

Function: Execute TML commands in TML source code, from a script file (as is entered in Command Interpreter).
Input arguments: pszFileName: The name of the file containing the TML source code to be executed.
Output arguments: return: TRUE if no error; FALSE if error
******************************************************************************

BOOL TML_EXPORT TS_GetOutputOfExecute(LPSTR pszOutput, int nMaxChars);

Function: Return the TML output code of the last previously executed library function call.
Input arguments: pszOutput: String containing the TML source code generated at the last library function call.
nMaxChars: maximum number of characters to return in the string
Output arguments: return: TRUE if no error; FALSE if error
******************************************************************************

BOOL TML_EXPORT TS_SetupLogger(WORD wLogBufferAddr, WORD wLogBufferLen, WORD* arrayAddresses, WORD countAddr, WORD period);

Function: Setup logger parameters (could be set up on a group/broadcast destination).
Input arguments: wLogBufferAddr: The address of logger buffer in drive memory, where data will be stored during logging
wLogBufferLen: The length in WORDs of the logger buffer
arrayAddresses: An array containing the drive memory addresses to be logged
countAddr: The number of memory addresses to be logged
period: How often to log the data: a value between 1 and 7FFF (useful only for new generation drives).
If it is different than 1, one set of data will be stored at every "period" samplings.
Output arguments:
return: TRUE if no error; FALSE if error
*******************************************************************************/

BOOL TML_EXPORT TS_StartLogger (WORD wLogBufferAddr, BYTE LogType);
/*******************************************************************************/
/* Function: Start the logger on a drive (could be started on a */
/* group/broadcast destination).
/* Input arguments: */
/* wLogBufferAddr: address of logger buffer (previously set by */
/* TS_SetupLogger) */
/* LogType: */
/* LOGGER_FAST: logging occurs in fast sampling */
/* control loop (current loop) */
/* LOGGER_SLOW: logging occurs in slow sampling */
/* control loop (position/speed loop) */
/* Output arguments: */
/* return: TRUE if no error; FALSE if error */
*******************************************************************************/

#endif
/*******************************************************************************/
/* Function: Upload logged data from the drive (destination must be a */
/* single axis). */
/* Input arguments: */
/* wLogBufferAddr: address of logger buffer (previously set by */
/* TS_SetupLogger) */
/* arrayValues: Pointer to the array where the uploaded data is */
/* stored on the PC */
/* countValues: The size of arrayValues */
/* Output arguments: */

arrayValues: uploaded logger data
countValues: The size of actualized data (lower or equal with countValues input value)

return: TRUE if no error; FALSE if error

*******************************************************************************

void TML_EXPORT TS_RegisterHandlerForUnrequestedDriveMessages(pfnCallbackRecvDriveMsg handler);

/*******************************************************************************/

Function: Register application's handler for unrequested drive messages.
Input arguments:
pfnCallbackRecvDriveMsg: pointer to handler
Output arguments:
*******************************************************************************

BOOL TML_EXPORT TS_CheckForUnrequestedDriveMessages(void);

/*******************************************************************************/

Function: Check if there are new unrequested drive messages and call handler for every message received.
Input arguments:
Output arguments:

return: TRUE if no error; FALSE if error
*******************************************************************************

BOOL TML_EXPORT TS_DriveInitialisation(void);

/*******************************************************************************/

Function: Execute ENDINIT command and verify if the setup table is valid. This function must be called only after TS_LoadSetup & TS_SetupAxis & TS_SelectAxis are called.
Input arguments:
Output arguments:

return: TRUE if no error; FALSE if error
